Resumen:

La familia Psittacidae presenta 21 de las 22 especies reconocidas, listadas en categorías de riesgo en México debido a los cambios de uso de suelo, deforestación, fuerte tráfico ilegal, y tala de árboles nido para saqueo de pollos. Sumado a la problemática, se carece para la mayoría de las especies de un diagnóstico actualizado sobre sus distribuciones, basado en datos de campo actuales. Existen estudios publicados (Ríos-Muñoz y Navarro-Sigüenza 2009), donde se han generado hipótesis de pérdida de distribución de las especies a partir de modelos ecológicos de nicho construidos a partir de registros de colecciones científicas, y cambios de uso de suelo en diferentes años, es decir cambios de distribución hipotética asociados a la pérdida de los tipos de vegetación original.

Sin embargo, las estimaciones de distribución basadas en datos históricos y disponibilidad de hábitat pueden sobre-estimar la distribución de los Psitácidos, ya que en ellos no hay forma de identificar las áreas donde la especie ha sido extirpada por el saqueo de nidos (Monterrubio-Rico et al. 2007), pero también pueden subestimar la distribución, ya que algunas especies pueden adaptarse bien a paisajes fragmentados con vegetación secundaria y áreas agropecuarias, ya que pueden alimentarse, descansar e incluso anidar mientras existan árboles de las dimensiones requeridas y hábitat primario disponible en distancias relativamente cortas de los nidos (Enkerlin-Hoeflich 1995, Monterrubio-Rico et al. 2009). Ante la evidencia obtenida, idealmente los modelos de distribución de Psitácidos deben basarse en verificación de campo, y si se desea ilustrar su distribución actual, es necesario basar los modelos en datos recientes para no sobre-estimar sus distribuciones actuales.

Ante la necesidad de contar con estimaciones actuales sobre la distribución de las especies de psitácidos, y considerando que las distribuciones de las especies en México son amplias, este proyecto plantea generar modelos de distribución integrando todos los datos disponibles (históricos y recientes), mediante la utilización de modelos de nicho ecológico (GARP y Maxent), y herramientas técnicas de SIG.

En el laboratorio de Ecología de Vertebrados Terrestres Prioritarios (UMSNH), se ha integrado la base de datos con mayor número de registros para el Pacífico de México. Se dispone de 14,303 registros que incluyen datos de especie, hábitat, localidad, coordenadas, número de individuos, hora de registro, fecha y actividad, de 15 especies de Psitácidos generados durante los últimos 8 años de trabajo de campo, provenientes de 922 coordenadas distintas. Además de los registros históricos y recientes obtenidos de Avian Knowledge Network y GBIF. Además se cuenta con la experiencia en el estudio del grupo, al haberse publicado 9 artículos de investigación, y formado recursos humanos (8) en temas sobre distribución, ecología de anidamiento, y dieta en especies de la familia Psittacidae. Se contará además con el apoyo técnico y asesoría en SIG por parte de la Geografía y maestra en Ciencias Consuelo Marín-Togo, quien es estudiante de doctorado y cuenta con amplia experiencia en la generación de cartografía digital en Psitácidos y recursos naturales, su currículum se anexa en archivos separados al de esta propuesta.

Ante la disponibilidad de registros recientes (2000-2011) de distribución observada en el Pacífico, y para algunos municipios del Golfo de México, es posible indicar en los mapas de distribución, sitios con presencia confirmada, y áreas de distribución potencial, así como áreas de probable extirpación para algunas especies (Monterrubio-Rico et al. 2010; Monterrubio-Rico et al. 2007).

Sin embargo, para la vertiente del Golfo y Península de Yucatán, no se dispone de un esfuerzo similar en registros de campo, por lo que no es posible generar mapas ilustrando patrones de abundancia de especies bajo el mismo rigor, ni mapas que permitan confirmar la distribución actual de varias especies, en estas únicamente se podría ilustrar su distribución potencial.

Psittacidae, distribución actual y potencial, registros recientes.

RESUMEN

El objetivo de este proyecto fue generar estimaciones de la distribución histórica y actual para las especies de la familia Psittacidae en México. Se generó para cada especie un modelo de distribución histórica potencial (estimación del área ocupada históricamente), empleando registros históricos (1800-1992), y registros actuales (1993-2013), registros e información disponible en literatura científica, y el empleo de los algoritmos GARP y Maxent para el modelado de las condiciones de aptitud ambiental de cada especie. También se generó un modelo de distribución potencial actual o contemporánea para cada especie (área de ocupación actual y áreas potenciales), mediante el análisis de la disponibilidad de los hábitats primarios, considerados como los hábitats óptimos de anidación, y de la presencia de registros de distribución recientes (≤ 20 años) de las especies de Psitácidos con respecto al modelo de distribución histórica. Se generaron modelos para 21 especies de Psitácidos presentes en el área continental de México: *Aratinga holochlora*, *Aratinga strenua*, *Aratinga nana*, *Aratinga canicularis*, *Ara militaris*, *Ara macao*, *Rhynchopsitta pachyrhyncha*, *Rhynchopsitta terrisi*, *Bolborhynchus lineola*, *Forpus cyanopygius*, *Brotogeris jugularis*, *Pionopsitta haematotis*, *Pionus senilis*, *Amazona albifrons*, *Amazona xantholora*, *Amazona viridigenalis*, *Amazona finschi*, *Amazona autumnalis*, *Amazona farinosa*, *Amazona oratrix*, y *Amazona auropalliata*. En este informe final se entregan 42 modelos de distribución (21 históricos y 21 actuales), y se integró la base de datos de distribución y ecología de Psitácidos de México en el laboratorio de Ecología de Vertebrados Terrestres Prioritarios de la Facultad de Biología de la Universidad Michoacana de San Nicolás de Hidalgo, en la que se dispone de 234 registros históricos (1836-1950), 194 registros antiguos (1951-1992), y 38,399 registros contemporáneos (1993-2013) obtenidos en múltiples proyectos de investigación de campo de los últimos 20 años dándose cumplimiento a los objetivos planteados.

INTRODUCCIÓN

Los Psitácidos son una de las familias de aves terrestres más carismáticas, varían de las vistosas guacamayas a los activos e inquietos pericos, y se adaptan muy bien a los ambientes humanos. En general son aves muy inteligentes y pueden sobrevivir en áreas urbanas alimentándose de cultivos y frutales de árboles de ornato. Por su inteligencia, suelen formarse vínculos afectivos muy fuertes hacia ellos como mascotas. El uso de estas aves como mascotas, sumado a las presiones ocasionadas por la destrucción y la transformación de sus hábitats naturales, las ha convertido en una de las familias de aves terrestres tropicales más vulnerables, y bajo el mayor riesgo de declinación y/o extinción en el neotrópico. Esta situación es particularmente crítica en México donde 21 de las 22 especies presentes están listadas en categorías de riesgo (Collar y Juniper 1992, Juniper y Parr 1998, Cantú *et al.* 2007, DOF 2010).

En México, las especies de Psitácidos son muy conocidas por los ciudadanos, ya que tanto en el medio rural como el urbano suelen ser mantenidas en cautiverio. Esto ha generado una demanda en el mercado local de mascotas, en lugar de motivar la recreación y su observación y estudio en vida silvestre. Por otro lado, sus amplios rangos hogareños, las dificultades para su captura y marcaje, sumado a que habitan en el dosel de bosques tropicales, donde su coloración críptica dificulta su localización, hacen que el estudio de los Psitácidos sea complicado y caro. Sumado a que la mayoría de las especies anidan en sitios inaccesibles como riscos y cavidades de árboles muy altos a nivel de dosel en bosques maduros (Snyder *et al.* 2000, Monterrubio-Rico *et al.* 2009). A pesar de las dificultades existentes en el estudio de estas aves, los Psitácidos también presentan oportunidades y retos importantes para la conservación. Son aves conspicuas y atractivas, pueden ser utilizadas como especies “bandera” en la preservación de ecosistemas amenazados, y como sus ámbitos hogareños son en general amplios, puede justificarse la protección de fragmentos grandes de bosques maduros, beneficiando a muchas especies de plantas y animales. Los Psitácidos por su vistosidad presentan un potencial importante para fomento de ecoturismo y con ello el beneficio económico de poblaciones locales (Snyder *et al.* 2000).

En México, además de las amenazas ya señaladas, los incendios forestales y la tala selectiva afectan la calidad del hábitat para la mayoría de las especies, principalmente los sitios de alimentación y de reproducción, teniendo un efecto negativo particularmente en las especies obligadas a anidar de cavidades de árboles (Monterrubio-Rico y Escalante-Pliego 2006); y la intoxicación por insecticidas afecta a especies que visitan cultivos de maíz o huertas, debido al daño que ocasionan en algunas regiones del país (Enkerlin-Hoeflich 1995). En México la familia Psittacidae presenta 22 especies (Howell y Webb 1995, Escalante *et al.* 1996), aunque la A.O.U.(American Ornithologist Union- Autoridad taxonómica para las aves de Norte y Centroamérica) sólo reconoce al taxón *Aratinga holochlora brevipes* (taxón endémico a Isla Socorro) a nivel subespecie. La normatividad actual en México enlista a todas las especies (exceptuando *Amazona autumnalis*), y a tres subespecies en alguna categoría de riesgo, a 10 especies (*Ara macao*, *Ara militaris*, *Rhynchopsitta terrisi*, *Rhynchopsitta pachyrhyncha*, *Amazona oratrix*, *Amazona auropalliata*, *Amazona viridigenalis*, *Amazona finschi*, *Amazona farinosa*, y *Pyrilia haematotis* anteriormente *Pionopsitta haematotis*), y tres subespecies (*Aratinga holochlora brevipes*, *Aratinga holochlora brewsteri* y *Forpus cyanopygius insularis*) en Peligro de extinción. Cuatro especies y una subespecie como Amenazadas (*Aratinga holochlora*, *Aratinga strenua*, *Bolborhynchus lineola*, *Brotogeris jugularis*, y *Pionus senilis*) y *Amazona xantholora*, *Aratinga canularis*, *Aratinga nana* y *Forpus cyanopygius* bajo Protección Especial (D. O. F. 2010).

Adicionalmente, seis de las especies: *Ara militaris*, *Amazona oratrix*, *Amazona auropalliata*, *Amazona finschi*, *Rhynchopsitta pachyrhyncha*, *Rhynchopsitta terrisi* y *Aratinga brevipes* están consideradas a nivel internacional en la lista roja de la UICN como vulnerables o en peligro de extinción (IUCN 2008), además de estar incluidas en el apéndice I de CITES la mayoría de ellas.

Siete especies son endémicas de México: *Amazona finschi*, *Amazona viridigenalis*, *Amazona xantholora*, *Rhynchopsitta terrisi*, *Rhynchopsitta pachyrhyncha*, *Aratinga brevipes*, y *Forpus cyanopygius* (Howell y Webb 1995), y *Amazona oratrix* presenta el área más grande de distribución a nivel global en México (Monterrubio-Rico *et al.* 2010).

Todas las especies sufren una fuerte explotación local y regional para el comercio doméstico de mascotas, que sumado a las elevadas tasas de deforestación de las regiones del país donde se distribuyen, son consideradas las principales causas del declive y reducciones en la distribución observados en las distintas especies (Ríos-Muñoz y Navarro-Sigüenza 2009, Monterrubio-Rico *et al.* 2010, Marín-Togo *et al.* 2012).

Al presentar la familia Psittacidae a casi todas sus especies en riesgo, en los últimos cinco años se han efectuado distintos estudios enfocados a evaluar su situación mediante el análisis de los cambios en su distribución como resultado de la disminución de sus hábitats primarios como medida indirecta de la situación de sus poblaciones silvestres (Ríos-Muñoz y Navarro-Sigüenza 2009). Se ha intentado estimar su distribución original, y los cambios de distribución hipotéticos mediante modelos de nicho ecológico con el algoritmo GARP, e imágenes de satélite que ilustran la pérdida de la vegetación y uso de suelo (Ríos-Muñoz y Navarro-Sigüenza 2009). Entre las predicciones basadas en disponibilidad de hábitat, se estima que cinco especies en su distribución por el Pacífico (*Amazona oratrix*, *Amazona auropalliata*, *Aratinga holochlora*, *Aratinga strenua* y *Brotogeris jugularis*) han sufrido una reducción de más de 50% en su distribución potencial debido a pérdida de hábitat (Ríos-Muñoz y Navarro-Sigüenza 2009). Sin embargo, estudios que se basan en datos de colecciones científicas y cambios de usos de suelo presentan ligeras limitantes, no pueden reflejar la distribución contemporánea si consideramos el efecto sinérgico de la fuerte pérdida de bosques tropicales de los últimos 50 años, y la fuerte presión de saqueo para el mercado de mascotas. Un estudio de caso que ilustra el impacto del saqueo en la distribución, en el se empleó modelos ecológicos de nicho y verificación de campo en *Amazona oratrix* en el Pacífico de México, y se estimó que la especie sufrió el 79% de reducción en su distribución (Monterrubio-Rico *et al.* 2010), más del 59% de reducción estimada basada en disponibilidad de hábitat (Ríos-Muñoz y Navarro-Sigüenza 2009). También se documentó que la especie ya no está presente en áreas donde estaba presente en los ochentas, y que todavía presentan hábitat (Monterrubio-Rico *et al.* 2007, 2010).

Las estimaciones de distribución basadas en datos históricos, y disponibilidad de hábitat pueden sobre-estimar la distribución de los Psitácidos, ya que en ellos no hay forma de identificar las áreas donde la especie ha sido extirpada por el saqueo de nidos (Monterrubio-Rico *et al.* 2007). En los modelos también se puede subestimar su distribución

ya que algunas especies pueden adaptarse a paisajes fragmentados o con vegetación secundaria y áreas agropecuarias. Los Psitácidos pueden alimentarse, descansar e incluso anidar mientras existan arboledas con disponibilidad de cavidades de dimensiones requeridas, y hábitat primario a corta distancia de los nidos (Enkerlin-Hoeflich 1995, Monterrubio-Rico *et al.* 2009). Ante la evidencia obtenida, los modelos de distribución en Psitácidos deben basarse en datos contemporáneos con amplia representatividad geográfica, y si se desea ilustrar su distribución actual, es necesario basar los modelos en datos recientes para no sub-estimar o sobre-estimar sus distribuciones actuales (Marín-Togo *et al.* 2012).

Ante la necesidad de disponer de estimaciones actuales sobre la distribución de las especies de Psitácidos, y considerando que las distribuciones de las especies en México son amplias, este proyecto planteó la generación de modelos de distribución integrando todos los datos disponibles (históricos y contemporáneos) y accesibles. Utilizando modelos de nicho ecológico (GARP y Maxent) y herramientas técnicas de Sistemas de información Geográfica. Ante la disponibilidad de registros recientes (2000-2013) con los que se dispone para la vertiente del Pacífico, Golfo de México, y Península de Yucatán, es posible indicar en los mapas resultantes sitios con presencia confirmada, áreas de distribución potencial, así como áreas de probable extirpación para algunas especies en riesgo como *Ara militaris*, *Amazona oratrix*, *Amazona farinosa*, y *Amazona finschi* (Monterrubio-Rico *et al.* 2010, Monterrubio-Rico *et al.* 2007, Marín-Togo *et al.* 2011).

DESARROLLO DEL PROYECTO

1. Calidad de la información.

1.1 Limpieza de datos.

1.1.1 Integración de base de datos de Psitácidos de México y su depuración geográfica.

Se integró la base de datos de Psitácidos de México a partir de registros obtenidos en proyectos de investigación en campo de los últimos 20 años, registros de ejemplares de colecciones científicas, y de revisión de literatura. Utilizamos como base 15,741 registros de 17 especies generados en varios proyectos durante los últimos 12 años por el Laboratorio de Ecología de Vertebrados Terrestres Prioritarios de la Facultad de Biología de la Universidad Michoacana de San Nicolás de Hidalgo. Los registros se obtuvieron para todos los estados de la vertiente del Pacífico (Sonora-Chiapas), centro-sur de Veracruz, norte de Veracruz, Huasteca de Hidalgo, Querétaro, San Luis Potosí y Tamaulipas. En esos proyectos contamos con la colaboración de investigadores de distintas instituciones, M en C Laura E. Villaseñor Gómez, Dr. Fernando Villaseñor Gómez, y Dr. Javier Salgado Ortiz (Universidad Michoacana de San Nicolás de Hidalgo); las Doctoras Katherine Renton y Patricia Escalante Pliego del Instituto de Biología de Universidad Nacional Autónoma de México, la Biol. Yamel Rubio Rocha, Universidad Autónoma de Sinaloa; la M en C Claudia Macías Caballero Instituto Tecnológico y de Estudios Superiores de Monterrey-PRONATURA A. C.; M en C Carlos Bonilla-Ruz Instituto Politécnico Nacional-CIIDIR Oaxaca; y el Dr. Adolfo Navarro Sigüenza, Museo de Zoología de Facultad de Ciencias UNAM. Los proyectos desarrollados durante ese lapso y que forman la comuna vertebral del análisis fueron los proyectos “Ecología y situación actual de las especies prioritarias de psitácidos en la vertiente del Pacífico Mexicano” clave SEMARNAT-CONACYT-2002-C01-00021, desarrollado durante el periodo 2003-2007; “Diagnóstico y propuestas sobre el potencial de manejo de la fauna silvestre en el bajo Balsas” Fondo Mixto CONACYT-Gobierno del Estado de Michoacán, Clave 41168 durante el periodo 2006-2008; “Monitoreo, fragmentación del hábitat y genética poblacional para la conservación de vertebrados en estatus de riesgo en la Reserva de la Biósfera de Los Tuxtlas”, Fondo Mixto

CONACYT-Gobierno del Estado de Veracruz Clave 109298, durante el periodo 2009-2011;“Evaluación poblacional del loro cabeza amarilla y el loro nuca amarilla en áreas prioritarias de Conservación, Comisión Nacional de Áreas Naturales Protegidas- CONANP –PROCER Clave 05 periodo 2012-2013; y PACE: Guacamaya verde. Conservación de la Guacamaya verde (*Ara militaris*) y su hábitat en áreas prioritarias de conservación en México, Comisión Nacional de Áreas Naturales Protegidas- CONANP –PROCER Clave 04 periodo 2012-2013.

Además, solicitamos la colaboración e invitamos a participar en este proyecto a colegas de distintas instituciones que disponían de registros de distribución contemporánea de Psitácidos de diferentes regiones de México. La Dra. Griselda Escalona Segura (ECOSUR), quien proporcionó 12,660 registros de los estados de la Península de Yucatán del periodo 1993-2007. Los M. en C. Juan de Dios Valdez Leal, M. en C. Coral Pacheco, y Dr. Stephan Arriaga Weiss (Universidad Juárez Autónoma de Tabasco), quienes incorporaron al análisis 4414 registros de los estados de Tabasco, Campeche, norte de Chiapas, y sur de Veracruz de los periodos 2003-2012. El Biol. Manuel Grosselet quien incorporo 88 registros de los últimos 5 años, principalmente del estado de Oaxaca y sur de Veracruz. El Dr. Miguel Ángel Martínez Morales (ECOSUR) con 12 registros. La Biol. Yamel Rubio Rocha (Universidad Autónoma de Sinaloa) quien proporcionó 408 registros de Sinaloa del periodo 2009-2011.

También solicitamos a la Comisión para el Conocimiento y uso de la Biodiversidad (CONABIO), nos proporcionara la información disponible en el SNIB, principalmente registros históricos y antiguos (1836-1992), que nos proporcionó 3988 registros disponibles para el periodo 1836-2003 correspondientes a 23 proyectos de investigación (Villaseñor-Gómez L. E. 2005, Vargas-Soriano J. 2005, Altamirano-González M. A. 2004, Navarro-Sigüenza A.G. 2004, Garza-Torres H. A. 2002, Enkerlin-Hoeflich 2001, Garza-Herrera A. 2001, León-Paniagua L. 2001, Arriag-Weiss S. L. 2000, Brito-Aguilar R. 2000, Morales Pérez J. E. 2000, León-Paniagua L. 1999, Ornelas-Rodríguez J. F. 1999, Salgado-Ortíz J. 1999, Enkerlin-Hoeflich E. C. 1998, Espinoza-Medinilla E. E. 1998, March-Mifsut I. J. 1998, Pozo de la Tijera M. C. 1998, Dredge-Davis D. M. 1997, Escalante-Pliego P. 1997, Pozo de la Tijera M. C. 1997). Además de 835 registros del periodo 2003-2010

provenientes de la base de datos en línea AverAves (CONABIO_averaves, 2010). También se revisó la base de datos Global Biodiversity Information Facility (GBIF, 2012), de la cual se obtuvo 8891 registros.

En total se dispuso de 52,541 registros, los cuales fueron sometidos a un primer proceso de depuración. Todos los registros fueron desplegados en el espacio geográfico y se revisó que la ubicación de los puntos de cada especie fuera congruente con su distribución histórica reconocida. Esta revisión se efectuó a partir de literatura especializada (Forshaw 1989, Howell y Webb 1995, Juniper y Parr 1998, Snyder *et al.* 2000) y la opinión de las observaciones de campo de expertos en Psitácidos (Dr. Tiberio C. Monterrubio Rico, Dra. Katherine Renton (Chamela-UNAM), M. en C. Yamel Rubio Rocha (UAS), M. en C. Juan de Dios Valdez Leal, M. en C. Coral Pacheco, y Dr. Stephan Arriaga Weiss (UJAT), Dra. Griselda Escalona Segura (ECOSUR), Roberto Pedraza Ruiz, Asesor Técnico del Grupo Ecológico Sierra Gorda IAP, M. en C. Claudia Macías (PRONATURA CHIAPAS), Ing. Alejandro Durán director de la Reserva de la Biósfera "Abra Tanchipa" en San Luis Potosí, Biól. Raúl Valencia Herverth (ITH), Biól. Manuel Grosselet). Se eliminaron aquellos registros cuya ubicación no correspondía con la distribución conocida a nivel región biogeográfica, ya que siempre existe la posibilidad de tener registros de Psitácidos ferales fuera de sus regiones naturales de distribución. Este hecho se debe a que los ejemplares pueden escapar de su condición de mascotas y sobrevivir en entornos rurales o suburbanos (Cuadro 1 y Anexo 1). Además, para el análisis bioclimático y generación de los modelos, se descartaron los registros que diferían por solo algunos segundos en sus coordenadas, además de que no todos los registros correspondían a coordenadas únicas. El primer proceso de depuración dio como resultado 3612 registros con coordenadas únicas e información suficiente como año del registro y localidad.

Una segunda revisión consolidó una base de datos de la familia Psittacidae para los modelos con un total de 3538 registros que corresponden a 21 especies de psitácidos mexicanos: *Aratinga holochlora*, *Aratinga strenua*, *Aratinga nana*, *Aratinga canicularis*, *Ara militaris*, *Ara macao*, *Rhynchopsitta pachyrhyncha*, *Rhynchopsitta terrisi*, *Bolborhynchus lineola*, *Forpus cyanopygius*, *Brotogeris jugularis*, *Pionopsitta haematotis*, *Pionus senilis*, *Amazona albifrons*, *Amazona xantholora*, *Amazona viridigenalis*, *Amazona*

finschi, *Amazona autumnalis*, *Amazona farinosa*, *Amazona oratrix*, y *Amazona auropalliata*. La especie con mayor número de registros que reunieron los requisitos fue *Aratinga nana* (542 registros), mientras que la especie con menos registros fue *Ara macao* (17 registros) (Cuadro 1).

Cuadro 1. Total de registros con coordenadas únicas por especie y registros descartados en segunda depuración.

Especie	Total de registros	Dudosos	Fuera de distribución
<i>Amazona albifrons</i>	388	0	0
<i>Amazona auropalliata</i>	66	0	0
<i>Amazona autumnalis</i>	216	3	5
<i>Amazona farinosa</i>	66	8	0
<i>Amazona finschi</i>	287	0	0
<i>Amazona oratrix</i>	227	0	0
<i>Amazona viridigenalis</i>	120	3	2
<i>Amazona xantholora</i>	136	1	0
<i>Aratinga canicularis</i>	466	0	1
<i>Aratinga holochlora</i>	204	6	11
<i>Ara macao</i>	17	0	0
<i>Ara militaris</i>	210	11	0
<i>Aratinga nana</i>	542	3	3
<i>Aratinga strenua</i>	33	1	0
<i>Bolborhynchus lineola</i>	32	0	1
<i>Brotogeris jugularis</i>	80	0	0
<i>Forpus cyanopygius</i>	55	0	0
<i>Pionopsitta haematotis</i>	63	0	2
<i>Pionus senilis</i>	251	8	4
<i>Rhynchopsitta pachyrhyncha</i>	116	2	4
<i>Rhynchopsitta terrisi</i>	69	0	1

1.1.2 Extracción de información climática y depuración ambiental

Para las localidades seleccionadas y validadas de cada especie, se extrajola información ambiental de 19 variables de Worlclim, usando Intersect Point Tool de Analysis Tools de la extensión Hawth's Tools en ArcGis 9.3. Se graficó la información ambiental de cada especie y se revisó la congruencia de los datos con respecto a los intervalos de temperatura y precipitación (Anexo 2). Se eliminaron datos con valores extremos (Cuadro 2).

Cuadro 2. Relación de registros preseleccionados preliminarmente y depurados ambientalmente.

Especie	Depurados geográficamente	Eliminados ambientalmente	Empleados en generar modelos
<i>Amazona albifrons</i>	388	1	387
<i>Amazona auropalliata</i>	66	1	65
<i>Amazona autumnalis</i>	208	1	207
<i>Amazona farinosa</i>	58	2	56
<i>Amazona finschi</i>	287	1	286
<i>Amazona oratrix</i>	227	0	227
<i>Amazona viridigenalis</i>	115	0	115
<i>Amazona xantholora</i>	135	0	135
<i>Aratinga canicularis</i>	465	2	463
<i>Aratinga holochlora</i>	187	0	187
<i>Ara macao</i>	17	0	17
<i>Ara militaris</i>	199	0	199
<i>Aratinga nana</i>	536	6	530
<i>Aratinga strenua</i>	32	0	32
<i>Bolborhynchus lineola</i>	31	5	26
<i>Brotogeris jugularis</i>	80	0	80

<i>Forpus cyanopygius</i>	55	0	55
<i>Pionopsitta haematotis</i>	61	7	54
<i>Pionus senilis</i>	239	0	239
<i>Rhynchopsitta pachyrhyncha</i>	110	0	110
<i>Rhynchopsitta terrisi</i>	68	0	68

Finalmente la base de datos obtenida y depurada quedo integrada con 3538 registros. La procedencia de los registros se conforma de la siguiente manera, el 45.8 % (n= 1622) fueron obtenidos de la bases de datos de los proyectos de investigación realizados durante los últimos 12 años por el Laboratorio de Ecología de Vertebrados Terrestres Prioritarios de la Facultad de Biología de la Universidad Michoacana de San Nicolás de Hidalgo. La segunda fuente de información, con el 23.3 % (n= 824) de los registros, fue la base de datos Global Biodiversity Information Facility (GBIF, 2012), seguido con el 17.4 % (n= 617) de registros proporcionados por colegas colaboradores (M. en C. Yamel Rubio Rocha (UAS), M. en C. Juan de Dios Valdez Leal, M. en C. Coral Pacheco, y Dr. Stephan Arriaga Weiss (UJAT), Dra. Griselda Escalona Segura (ECOSUR), M. en C. Claudia Macías (PRONATURA CHIAPAS), Biol. Manuel Grosselet, Dr. Miguel Ángel Martínez Morales (ECOSUR)). El 10.1% de los registros empleados provienen de los datos proporcionados por CONABIO obtenidos por diverso proyectos (Navarro-Sigüenza 1111, Escalante-Pliego 1997, Enkerlin-Hoeflich 1998, Espinoza-Medinilla 1998, March-Mifsut 1998, Dredge-Davis 1999, León-Paniagua 1999, Ornelas-Rodríguez 1999, Salgado-Ortiz 1999, Arriaga-Weiss 2000, Brito-Aguilar 2000, Enkerlin-Hoeflich 2000, Morales-Pérez 2000, Enkerlin-Hoeflich 2001, Garza-Herrera 2001, León-Paniagua 2001, Altamirano-González 2004, Navarro-Sigüenza 2004, Vargas-Soriano 2005, Villaseñor-Gómez 2005), y en menores porcentajes con el 1.9% provenientes de literatura científica e informes técnicos (Howell 1999, Gaucín-Ríos 2000, Muñoz-Martínez 2001, Almazán-Núñez y Nova-Muñoz 2006, Sierra-Franco 2006, Arizmendi 2008, Hernández-Castán 2012, Jiménez-Arcos *et al.* 2012, y Villaseñor y Botello 2012), y por último el 1.5% de registros de la herramienta de la base de datos de CONABIO-Averaves (CONABIO-AverAves 2010)(Cuadro 3).

Cuadro 3. Número de registros por especie y por fuente con coordenadas únicas y útiles para modelar.

1.2 Perfil bioclimático.

Con los datos depurados se construyó el perfil bioclimático de cada una de las 21 especies. Se presenta un cuadro-resumen para cada especie con número de datos, media, mínimo, máximo y desviación estándar para las 19 variables de Worldclim (Anexo 3). También se presenta la matriz de datos usada para construirlos (Anexo 4), así como gráficas de caja para cada variable por especie (Anexo 5).

2. Criterio de selección de la región de referencia (M) por especie

El área sobre la cual se modeló la distribución potencial se obtuvo a partir de recortes basados en cuencas hidrográficas asociadas a límites regionales-biogeográficos y a la distribución potencial histórica conocida de cada especie disponible en la página de la CONABIO (<http://www.conabio.gob.mx/informacion/gis/>). Se determinó utilizar estos criterios para considerar los aspectos históricos que han afectado la distribución de las especies, y así eliminar zonas donde se sabe que la especie no está actualmente (Illoldi-Rangel y Escalante 2008). Esto se aplicó especialmente en aquellas especies con distribución discontinua sobre grandes regiones (por ejemplo *Ara militaris*) o puntual asociada a ambientes y hábitats específicos (rareza ecológica), como ocurre por ejemplo en *Bolborhynchus lineola* (Howell y Webb 1995). El conocimiento sobre los requisitos ecológicos de los psitácidos mexicanos es muy limitado debido a que la información se ha analizado de manera individual para algunas especies (Macías y Iñigo 2003), o para regiones muy localizadas (Morales-Pérez 2005).

3. Variables utilizadas en la modelación

Los registros de las especies, verificados geográfica y ambientalmente, se contrastaron con información ambiental de 19 variables climáticas (temperatura y precipitación) obtenidas de Worldclim. Se usó la herramienta Hawth's Tools (Beyer 2004) en ArcMap versión 9.3, para extraer la información ambiental de cada punto (Analysis Tools-Intersect point tool). Posteriormente la información se exportó a un archivo de base de datos, y se usó el programa JMP versión 8 (SAS Institute Inc. 2008), para realizar un análisis de regresión, mediante el cual se analizó la correlación entre variables a través del coeficiente de

determinación (r^2). Este coeficiente expresa el porcentaje de relación entre dos variables cuantitativas, independientemente de si es una relación negativa o positiva (Zar 1996). El coeficiente de determinación (r^2) nos dice qué tanto se ajusta la línea de regresión a los datos (Zar 1996). Una vez obtenidos los valores de correlación de cada variable con las demás variables, se calculó su promedio de correlación con las otras variables, y se determinó usar las variables con menos de 25% de correlación, con excepción de las especies *Aratinga strenua* y *Amazona auropalliata* para las que se usaron las variables con correlación menor a 30% (Anexos 6).

Para la generación de los modelos se utilizó un máximo de 16 variables ambientales para dos especies, *Amazona albifrons* y *Aratinga holochlora* y un mínimo de 4 variables para *Brotogeris jugularis* y *Rhynchopsitta terrisi*.

4. Método de modelación

Se estimó la distribución potencial histórica y actual de las 21 especies de Psitácidos continentales reconocidos para México (AOU 1998). Se usaron como datos de presencia de las especies de la familia Psittacidae los registros reunidos mediante proyectos de investigación, disponibles en bases de datos nacionales e internacionales (Global Biodiversity Information Facility data bases) (GBIF 2000), los proporcionados por colegas y por CONABIO, y los obtenidos de revisión de literatura (Cuadro 3). Una vez reunida la base de datos, los registros se depuraron con el fin de estandarizar la información, y separarlos registros fuera de sus distribuciones reconocidas. En un principio se planteó usar datos sin coordenada pero que si contuvieran la referencia al sitio de colecta u observación, con la idea de georreferenciarlos usando el manual de la CONABIO “Georreferenciación de localidades de colecciones biológicas”. Sin embargo esto planteó muchos problemas porque la mayoría de los datos sin coordenadas no tienen referencias completas, y a veces tienen referencias a sitios no reconocidos como localidades, por lo que se decidió usar solo datos con georreferencia original, además de que se disponía de registros suficientes con coordenadas para la mayoría de las especies.

En cuanto al arreglo taxonómico, originalmente se planteó usar como criterio lo establecido por la Unión de Ornitólogos Americanos, incluidos los nombres científicos reconocidos actualmente (AOU 1998, AOU 2011). Sin embargo se decidió identificar a

Pyrrhuloxia haematotis como anteriormente se hacía (*Pinopsitta haematotis*), para homologar con el nombre usado oficialmente en la normatividad de México.

4.1 Distribución histórica

Para modelar la distribución histórica potencial (estimación del área ocupada históricamente) se usaron algoritmos matemáticos que utilizan como base teórica el nicho ecológico: Genetic Algorithm for Rules Set Prediction (GARP) y Maximum entropy (Maxent). GARP utiliza un algoritmo genético para la búsqueda de asociaciones entre variables ambientales y la ocurrencia conocida de las especies, contrastándola con las características ambientales a lo largo de toda el área de estudio. Este algoritmo ha mostrado excelente capacidad para generar modelos precisos bajo condiciones difíciles de análisis y ha demostrado buen rendimiento en estudios comparativos recientes (Peterson *et al.* 2002, Stockwell y Peterson 2002, Papes y Gaubert 2007, Peterson *et al.* 2007, Tsoar *et al.* 2007), en particular con aves mexicanas (Ortega-Huerta y Peterson 2008).

Por otra parte, Maxent se fundamenta en el concepto de máxima entropía, utiliza una aproximación para realizar predicciones a partir de información incompleta, estima la distribución más uniforme a lo largo del área de estudio con la restricción de que el valor esperado para cada variable ambiental en una distribución concuerda con su promedio empírico. Tiene como ventaja el proporcionar curvas de respuesta de la especie ante las distintas variables ambientales y estimar la importancia de cada una en la distribución de la especie (Phillips *et al.* 2004, 2006).

Las variables que se usaron para generar los modelos fueron capas de información climática de temperatura y precipitación que se obtuvieron de WORLDCLIM (www.worldclim.org). Sin embargo no se usaron las 19 variables disponibles de forma directa para todas las especies ya que existe una fuerte autocorrelación en varias de ellas, por lo que para evitar sobreajuste de los modelos, sólo se usaron aquellas que analizadas en particular para cada especie tuvieron menores valores promedio de correlación. Todas las capas de información se usaron con una resolución de 30 segundos equivalente en México por su latitud a aproximadamente 1000 m por lado.

Posterior a la modelación, en aquellas especies en las que el modelo proyectó aptitud más allá del área reconocida de distribución, se eliminó la proyección sobrante o sobre estimación usando límites municipales, los cuales de acuerdo con Marín-Togo *et al.*

(2012) coinciden en lo general con límites naturales como cuencas, parteaguas o cañadas. Lo cual fue verificado en cada caso contrastando el archivo de los municipios con la capa de microcuencas correspondientes.

Para la generación de los modelos de distribución histórica, sólo se usaron coordenadas únicas. En la propuesta original se había planteado que los registros serían divididos al azar en 50% para modelar y el 50% restante para validarlos. Sin embargo para evitar la autocorrelación entre datos que esto puede implicar, se decidió que los registros fueran divididos siguiendo un criterio de bandas latitudinales de 15 km de ancho, seleccionando los datos por bandas alternadas para usar una parte para modelar la distribución histórica potencial (área ocupada), y la otra parte para validar los modelos externamente (Cuadro 4). Originalmente se había planteado que cada algoritmo fuera programado para que una porción de los datos se usara para entrenamiento y la otra para prueba interna del modelo, y de hecho se hicieron varias pruebas con todas las especies. Lo que se encontró fue que incluso en las especies que parecerían tener más datos (por ejemplo *Amazona oratrix*= 227) se observaron problemas de subestimación del área de distribución predicha. Esto ocurrió con la mayoría de las especies, lo que atribuimos a que a pesar de la gran cantidad de datos concentrados por especie, aún falta información que represente completamente la distribución ecológica y geográfica de la mayoría de las especies. Por esta razón se decidió usar en los programas la opción de 100% de datos para entrenar los modelos, no obstante este porcentaje no representa la totalidad de datos con la que se dispuso, pues como se menciona arriba en el documento, una proporción fue separada para validación externa a los algoritmos (Cuadro 4).

Cuadro 4. Coordenadas usadas en la modelación y en la validación externa y su total.

Especie	Modelar	%	Validar	%	TOTAL
<i>Amazona albifrons</i>	203	52.5	184	47.5	387
<i>Amazona auropalliata</i>	34	52.3	31	47.7	65

TOTAL	1975	55.8	1563	44.2	3538

En GARP se desarrollaron 100 réplicas del modelo para cada especie, y se usó la opción de seleccionar los diez mejores modelos, que considera valores de tasa de error de omisión menores a 10%, mismos que fueron sumados para obtener finalmente un mapa

compuesto que representa en el espacio geográfico la distribución de las condiciones ambientales adecuadas para cada especie (Anderson *et al.* 2003, Soberón y Peterson 2005). La reclasificación de los modelos resultantes se hizo usando un umbral conservador, para evitar sobreestimar la áreas de presencia (Papes y Gaubert 2007), en GARP se analizaron las coincidencias de los registros de campo usados para generar el modelo con cada uno de los diez mejores modelos de cada especie, y se consideró como las áreas de distribución potencial aquellas que en el consenso de modelos, presentaran la mayor coincidencia con los registros. Mientras que en Maxent, cada modelo resultante fue reclasificado utilizando el umbral “Minimum training presence” debido a que presenta los valores más bajos de omisión y la menor superficie de presencia, lo cual elimina los errores de comisión. Así, en ambos casos se buscó disminuir la omisión de datos usados (Cuadro 5).

Después de la reclasificación, los modelos de *Bolborhynchus lineola*, *Rhynchopsitta pachyrhyncha*, y *Rhynchopsitta terrisi* fueron acotados de acuerdo a los límites extremos de elevación de los registros de cada especie, apartir del modelo digital de elevación del continuo de elevaciones Mexicano (INEGI 2011). El objetivo de esta delimitación es proyectar una distribución potencial a un nivel más detallado para aquellas especies que si bien su rango geográfico parece amplio, en términos ecológicos se ve reducido al estar asociado a intervalos ambientales estrechos. Cabe resaltar que con este procedimiento no se afecta el espacio (m) definido antes de modelar, sino que se detalla cuáles son las áreas que efectivamente podrían estar usando las especies.

Cuadro 5. Valores con los cuales se realizó la reclasificación de los modelos.

Especie	Modelos de consenso (GARP)	Umbral de probabilidad (Maxent)
<i>Amazona albifrons</i>	2	0.036
<i>Amazona auropalliata</i>	7	0.322
<i>Amazona autumnalis</i>	2	0.053
<i>Amazona farinosa</i>	5	0.265

<i>Amazona finschi</i>	2	0.004
<i>Amazona oratrix</i>	1	0.14
<i>Amazona viridigenalis</i>	5	0.008
<i>Amazona xantholora</i>	2	0.185
<i>Ara macao</i>	10	0.37
<i>Ara militaris</i>	3	0.06
<i>Aratinga canicularis</i>	2	0.005
<i>Aratinga holochlora</i>	4	0.033
<i>Aratinga nana</i>	1	0.086
<i>Aratinga strenua</i>	7	0.249
<i>Bolborhynchus lineola</i>	10	0.368
<i>Brotogeris jugularis</i>	2	0.258
<i>Forpus cyanopygius</i>	8	0.036
<i>Pionopsitta haematotis</i>	10	0.27
<i>Pionus senilis</i>	1	0.101
<i>Rhynchopsitta pachyrhyncha</i>	1	0.008
<i>Rhynchopsitta terrisi</i>	5	0.017

4.2 Áreas de distribución actual

Las áreas de distribución potencial actual fueron aproximadas a partir de la distribución potencial histórica (área ocupada históricamente), y fue delimitada usando el tipo de vegetación de la Serie IV (INEGI 2009), para considerar sólo como áreas de distribución aquellas que en la literatura científica y con base en la experiencia en campo corresponden

con hábitats de anidación de cada especie. Se dejó fuera de la distribución potencial actual aquellas áreas cuya modificación en la cobertura del suelo ha sido drástica (pastizales extensivos, áreas de suelo desnudo, arena, centros urbanos, etc.). Adicionalmente para las especies; *Ara militaris*, *Ara macao*, *Rhynchopsitta pachyrhyncha*, *Forpus cyanopygius*, *Amazona albifrons*, *Amazona finschi*, *Amazona oratrix* se eliminó de la distribución potencial histórica, aquellos municipios donde no ha sido confirmada la presencia de la especie, aun cuando se han realizado muestreo de campo recientemente. Es importante resaltar que no se está considerando los efectos que la fragmentación (tamaño de parche, distancias entre parches, distancia de los parches a masas continuas de bosques) a pesar de que se conoce y se ha observado que algunas especies (Por ejemplo *Amazona oratrix* en Tamaulipas) en algunas regiones pueden anidar en áreas perturbadas, siempre y cuando existan árboles de tallas grandes y no exista presión de saqueo. En este sentido, en esta delimitación de la distribución actual estamos considerando todos los hábitats arbolados (tipos de vegetación), sin hacer consideraciones sobre la fragmentación, sucesión o estado de conservación.

Finalmente los modelos resultantes de GARP y Maxent se compararon en términos de extensión como una forma de evaluar su precisión. Aun cuando estos algoritmos operan bajo procedimientos diferentes, ambos se basan en el modelado del nicho ecológico, y dado que en su generación se usaron las mismas variables climáticas y registros de presencia de las especies para generar los modelos, hipotetizamos que se esperarían resultados similares en términos de la coincidencia de la distribución histórica (área ocupada), y también de la distribución actual pues se usaron los mismos procedimientos e insumos para delimitarla. Para cada especie de psitácido se obtuvieron cuatro mapas de distribución; el de distribución potencial histórica (área ocupada), y el de distribución potencial actual (disponibilidad del hábitat) con cada algoritmo.

5. Parámetros utilizados en la modelación

GARP

Se utilizó GARP versión 1.1.6. Se programó para que usara el 100% de los datos ingresados para entrenamiento del modelo y se establecieron 100 corridas por experimento, con un límite de convergencia 0.01 y un máximo de iteraciones de 1000. Se usaron todas las reglas (atómicas, de rango, de rango negado, regresión logística). Se programó para que los diez mejores modelos fueran seleccionados, considerando 10% de omisión, 20 modelos bajo el umbral de omisión y 50% de la distribución en el umbral de comisión. Se dejó la opción de que usara todas las capas seleccionadas.

MAXENT

La versión utilizada para la modelación fue Maxent 3.3.3. Se activaron las opciones “Create response curves”, “Make pictures of predictions” y “Do jackknife to measure variable importance”. El formato de salida seleccionado fue “Logistic” y el tipo de archivo de salida fue “asc”. En Settings (Advanced) se desactivó la opción “Do sampling”. Con Maxent, cada modelo resultante fue reclasificado utilizando el umbral con los valores de máxima probabilidad con la finalidad de disminuir la omisión de registros.

6. Evaluación del modelo

La evaluación de los modelos se hizo con el método de "ROC parcial", que ha demostrado ser más efectivo al ponderar los errores de omisión, no considerar las ausencias y evaluar sólo sobre en el rango de valores de predicción (Peterson *et al.* 2008). Se usó el programa Tool for Partial-ROC versión 1.0 (Narayani 2008). Los dos subconjuntos de datos separados para cada especie (archivos de presencia) fueron contrastados con la suma de los diez mejores modelos (GARP) y con el modelo reclasificado en probabilidades (Maxent), para obtener los valores sobre los que coinciden los puntos (valor de adecuación). También se extrajo el número de objetos asociados a los distintos valores de adecuación, dividido entre el total de objetos del modelo. Los archivos preparados en formato CSV se ingresaron al programa Tool for Partial-ROC versión 1.0. Se usó una proporción de puntos para "Bootstrap" de 50%, el número de muestra con remplazo fue de 1000, y el umbral de omisión usado fue de 95%. Se promedió el valor de radio de las 1000 iteraciones de los datos usados para el entrenamiento y prueba de los modelos, y se calculó la probabilidad de que el valor fuera menor o igual a 1, mediante una prueba de z.

De acuerdo con Peterson *et al.* (2008), se consideran buenos modelos, aquellos cuyos valores promedio de radio sean mayores a 1 y con probabilidad de 0. En general, los resultados de la evaluación indican que los modelos son buenos, ya que todos tuvieron valores promedio de radio mayores a 1, usando tanto los conjuntos de datos de prueba como los conjuntos de modelación. Fueron similares en la mayoría de los modelos con ambos algoritmos, aunque ligeramente más altos en la mayoría de los modelos de MaxEnt. Es relevante mencionar que se observaron algunas diferencias entre modelos que presentaron probabilidades mayores a 0. Se observaron diferencias en el conjunto de datos de prueba en los modelos de *Amazona farinosa*, *Aratinga strenua*, y *Bolborhynchus lineola*, cuyos modelos fueron mejores con MaxEnt, ya que con este algoritmo presentaron probabilidades de 0. También se observaron diferencias en los modelos de *Amazona auropalliata* y *Ara macao*, con el conjunto de datos de prueba y en el modelo de *Aratinga holochlora* con el conjunto de datos de modelación, en estos casos, los modelos fueron mejores con GARP. Los modelos que se pueden considerar que tuvieron el peor desempeño son los de *Pionopsitta haematotis*, *Rhynchopsitta pachyrhyncha*, y *Rhynchopsitta terrisi*, ya

que con ambos algoritmos presentaron una probabilidad mayor a 0 en alguno de los conjuntos de datos (Cuadro 6).

RESULTADOS

Se estimó la distribución potencial histórica para 21 especies de Psitácidos mexicanos usando dos algoritmos. Mediante el algoritmo Maxent, las especies que presentaron mayor distribución histórica potencial fueron *Rhynchopsitta pachyrhyncha*, *Ara militaris* y *Amazona albifrons* y las predicciones para las tres especies proyectaron un área superior a los 400,000 km². La menor distribución potencial histórica o distribución original se estimó para *Amazona auropalliata* con 12,833 km². Mediante el algoritmo GARP las estimaciones de distribución fueron menores en general, y las especies con mayor distribución original predicha fueron *Amazona albifrons*, *Ara militaris* y *Pionus senilis*, y la especie con la menor distribución histórica potencial fue *Aratinga strenua* con 8,282 km² (Cuadro 7). De acuerdo a la evaluación ROC parcial se desempeñó mejor MaxEnt, aunque ambos algoritmos mostraron similitudes consistentes en los patrones geográficos de distribución potencial de las especies. Ambos algoritmos coincidieron en los modelos de las especies con peor desempeño de acuerdo a la evaluación (*Pionopsitta haematotis*, *Rhynchopsitta pachyrhyncha*, y *Rhynchopsitta terrisi*).

En general para la mayoría de las especies (15), los modelos generados con Maxent presentaron estimaciones de superficie mayores, y en general las diferencias fueron superiores al 15%. Los casos más extremos se observaron para las estimaciones de *Aratinga strenua*, cuya estimación con Maxent fue 191.8% superior a la estimación generada con GARP. Otra especie con una situación similar fue *Ara macao*, cuya distribución proyectada por Maxent es 105,797 km², que representa una superficie 123.4% superior que la estimación efectuada por GARP que fue de 47,045 km². Únicamente en los modelos generados para *Amazona albifrons* y *Aratinga nana*, las diferencias en las estimaciones entre ambos algoritmos resultaron menores al 5% (1.1% y 4.9% respectivamente). Se puede notar que las mayores diferencias en las estimaciones hechas con ambos algoritmos se presentaron en las especies con menor cantidad de datos disponibles, lo que puede influir para no tener un funcionamiento óptimo en los algoritmos. Con respecto a la distribución actual, las estimaciones de la extensión basadas en los modelos generados mediante Maxent también resultaron mayores que las obtenidas mediante GARP en la mayoría de las especies. Las especies con la mayor distribución

actual de áreas con aptitud para su distribución potencial son *Ara militaris*, *Amazona albifrons* y *Aratinga canicularis*, y las que presentan la menor distribución son *Amazona auropalliata*, con 3,252 km² y *Brotogeris jugularis* con 7,562 km². Mediante las predicciones basadas en GARP, las especies con menor área de extensión con aptitud ecológica son *Amazona auropalliata* con 2,013 km² y *Aratinga strenua* con 3,234 km².

Las estimaciones de GARP fueron mayores en extensión que las predicciones hechas por Maxent para cuatro especies, sin embargo las diferencias fueron menores al 5% *Amazona autumnalis* (2.3%), *Amazona oratrix* (4.7%), *Aratinga holochlora* (3.7%), y *Pionus senilis* (0.001%). En general, solo en seis especies las estimaciones generadas por Maxent y GARP presentaron diferencias menores al 5%, por lo que pueden considerarse como predicciones similares (Cuadro 7).

En las estimaciones de distribución potencial actual, se observó el mismo patrón que en los modelos de distribución histórica u original, siendo las estimaciones basadas en los modelos generados con Maxent considerablemente más grandes, que las estimaciones basadas en los modelos generados por GARP. Sólo en las estimaciones para *Amazona albifrons*, *Amazona autumnalis*, *Amazona oratrix* y *Aratinga holochlora* las estimaciones fueron superiores con GARP que con Maxent, y las diferencias observadas en estos modelos fueron pequeñas (\leq a 5%), o moderadas (\leq a 10%). Las diferencias más grandes se observaron en las estimaciones hechas para *Aratinga strenua* cuya estimación con Maxent (11,091 km²), fue 242% superior a la estimación generada con GARP (3,234 km²). Otra especie en la que se observó una situación similar fue en *Pionopsitta haematotis*, cuya distribución obtenida con Maxent es 93,699 km², que es 121.6% superior en superficie que la estimación efectuada con GARP que fue de 42,271 km². Es importante notar el caso de *Ara macao*, que si bien existen diferencias grandes entre la superficie estimada por cada algoritmo para su distribución potencial histórica, en el momento de estimar su distribución potencial actual esta diferencia se minimiza (9.7%), por lo que consideramos sumamente importante incorporar a los modelos de distribución todo el conocimiento biológico y ecológico acerca de las especies de Psitácidos, y ponemos de manifiesto que aún existen carencias en ese sentido, que es necesario subsanar a fin de que esa información permita estimar modelos más precisos sobre la distribución de los Psitácidos (Cuadro 7).

Finalmente, con base en los modelos de distribución histórica potencial y la estimación de distribución actual, independientemente del algoritmo, se estima que todas las especies han presentado pérdida de distribución. Las estimaciones basadas en Maxent revelan que las especies que han perdido la mayor extensión de superficie en condiciones de aptitud es *Ara macao*, con 86.5% de su distribución potencial histórica, seguida de *Amazona oratrix* y *Amazona auropalliata* con 77.4% y 74.7% respectivamente. Mientras que las especies que han presentado menor superficie de pérdida es *Amazona xantholora* con sólo 18.9%.

En las estimaciones basadas en los modelos generados con GARP, las especies con mayores pérdidas de superficie en condiciones de aptitud son *Amazona auropalliata* (78.6%), *Amazona oratrix* (76.1%) y *Ara macao* (72.7%) respectivamente. Las especies con menor pérdida de superficie en condiciones de aptitud ecológica para su distribución potencial es también *Amazona xantholora* con 16.3% (Cuadro 8). Todos los modelos y sus metadatos correspondientes se documentan en el Anexo 7.

En esta investigación los modelos generados con MaxEnt presentaron en general un mejor desempeño de acuerdo a la evaluación, y aunque los modelos obtenidos con ambos algoritmos fueron similares en sus patrones geográficos, la mayoría de los modelos de GARP presentaron menor extensión, así que los modelos de MaxEnt fueron más cercanos a lo que se conoce en la literatura sobre la distribución de las especies. Sin embargo se debe tener en cuenta la carencia de datos de presencia para algunas especies que podría ser un sesgo importante en el proceso de modelado con cualquier algoritmo. Finalmente una validación ideal sería la comprobación en campo de las áreas predichas para las especies en que se dispuso de pocos datos recientes como *Bolborhynchus lineola* o *Ara macao*.

Cuadro 7. Cuadro comparativo entre áreas de distribución de condiciones de aptitud para la distribución potencial histórica y distribución actual en base a cada algoritmo.

CONCLUSIONES Y RECOMENDACIONES

Se logró estimar la distribución potencial histórica y actual de 21 especies de Psitácidos presentes en México, con base en registros actuales e históricos disponibles, y capas de información climática, usando los algoritmos GARP y Maxent y análisis de cambio de uso de suelo. Resaltamos que la base de datos integrada durante este proyecto, y en la que se basan los modelos es la más completa por su cobertura geográfica y es además la más vigente ya que un porcentaje elevado de registros son de trabajo de campo efectuado en los últimos 10 años. La información es reciente y confiable en cuanto a la presencia de psitácidos mexicanos.

Sin embargo la mayor limitante en el alcance de los modelos es la baja disponibilidad de registros recientes para algunas especies en Peligro de extinción y cuya distribución se ha reducido, como es el caso de *Ara macao*. Los registros obtenidos para esta especie no representan adecuadamente la distribución hipotética reconocida, lo que complica la modelación de su distribución histórica y actual. Existen especies con pocas localidades de registro (menos de 35), como *Ara macao*, *Bolborhynchus lineola*, y *Aratinga strenua*, y que sin duda una mayor representación geográfica de datos ayudaría a obtener modelos más robustos. También es necesario resaltar el caso de *Aratinga holochlora* especie con poblaciones disjuntas en el Pacífico y en el Golfo, y cuya población en el Pacífico cuenta con pocas localidades de registro. Otras especies con pocas localidades de registro (ente 50 y 60) son *Pionopsitta haematotis*, *Forpus cyanopygius* y *Amazona farinosa*. Para estos casos se recomienda aumentar el trabajo de campo a fin de actualizar la información sobre su presencia.

Los modelos podrían ser mejorados a partir de la existencia de estudios sobre requerimientos de anidación, ya que los psitácidos pueden adaptarse a ambientes fragmentados para alimentarse pero son muy sensibles a la disponibilidad de sitios de anidación. Las distribuciones pueden ser muy extensas en lo general, pero el hábitat óptimo puede ser muy reducido y esto difícilmente se puede deducir de modelos que no incorporan información de requerimientos de anidación.

Información adicional que permitiría depurar los modelos y afinarlos es disponer de datos sobre ámbito hogareño para todas las especies, mediante ellos se podrían delimitar de

manera más precisa aspectos como el área o los tipos de vegetación que potencialmente usan.

De acuerdo con los resultados obtenidos en este proyecto, todas las especies han perdido superficie en la distribución actual con respecto a su distribución histórica. Sin embargo, existen especies como *Amazona auropalliata*, *Amazona oratrix* y *Ara macao* en las que la pérdida de distribución ha sido enorme debido principalmente a la pérdida de hábitat.

Es importante seguir realizando trabajos de campo enfocados en la verificación de la presencia de especies, y validar las áreas donde los modelos proyectan distribución potencial, principalmente para aquellas que existe poca información de campo como *Ara macao*, *Bolborhynchus lineola*, y *Aratinga strenua*.

AGRADECIMIENTOS

Apreciamos el apoyo y colaboración para la realización de este proyecto a Manuel Grosselet, M. en C. Yamel Guadalupe Rubio Rocha de la Universidad Autónoma de Sinaloa, Dr. Carlos Bonilla Ruz y la M. en C. Claudia Cinta Magallón de la fundación Unidos por las Guacamayas A. C., Dra. Katherine Renton de la Estación de Biología Chamela, UNAM, M. en C. Juan de Dios Valdez Leal, M. en C. Coral Pacheco, y Dr. Stephan Arriaga Weiss (UJAT), Dra. Griselda Escalona Segura (ECOSUR), Roberto Pedraza Ruiz, Asesor Técnico del Grupo Ecológico Sierra Gorda IAP, M. en C. Claudia Macías (PRONATURA CHIAPAS), Ing. Alejandro Durán director de la Reserva de la Biósfera "Abra Tanchipa" en San Luis Potosí, Biól. Raúl Valencia Herverth (ITH), al Dr. Miguel Ángel Martínez Morales (ECOSUR). Agradecemos al Dr. Fernando Villaseñor Gómez, director de la Facultad de Biología por proporcionar todo el apoyo logístico Institucional.

ANEXOS

Anexo 1. Revisión y depuración geográfica de los datos.

Figura1. Proyección geográfica de localidades de *Amazona albifrons* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución.

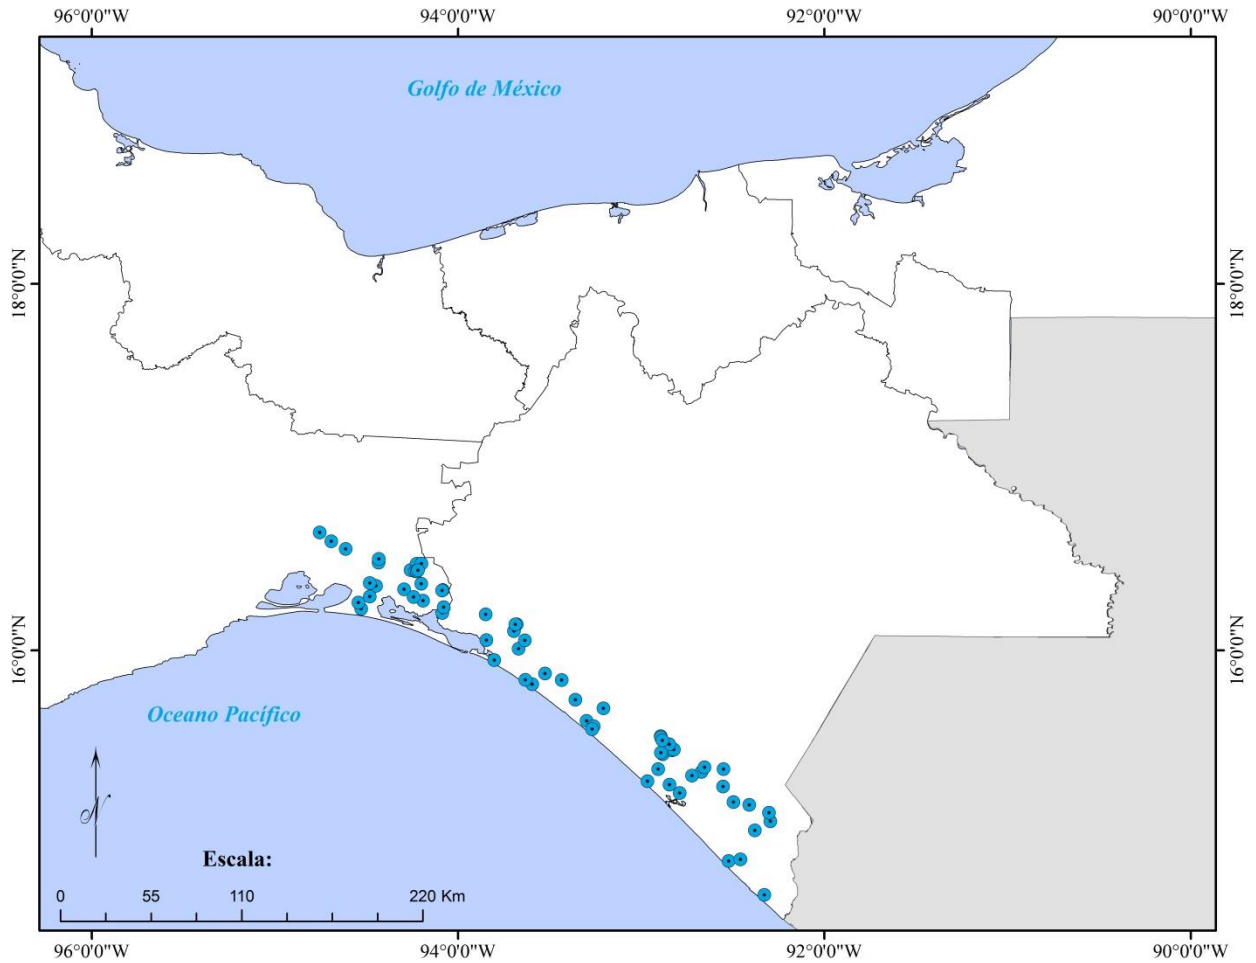

Figura 2. Proyección geográfica de localidades de *Amazona auropalliata* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución.

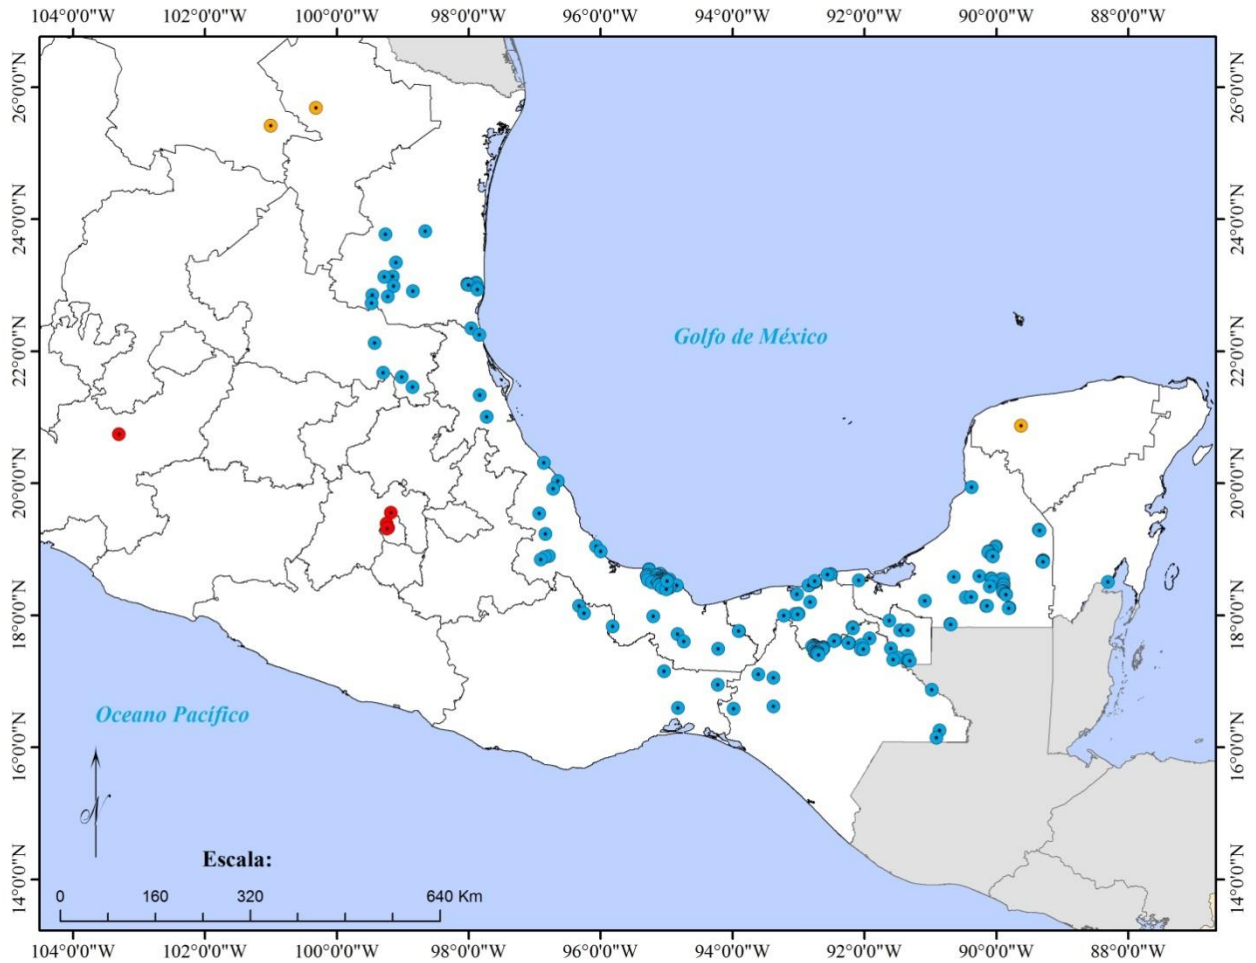

Figura 3. Proyección geográfica de localidades de *Amazona autumnalis* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas. Rojas: Localidades no utilizadas en la modelación, ya que están notoriamente fuera del área de distribución.

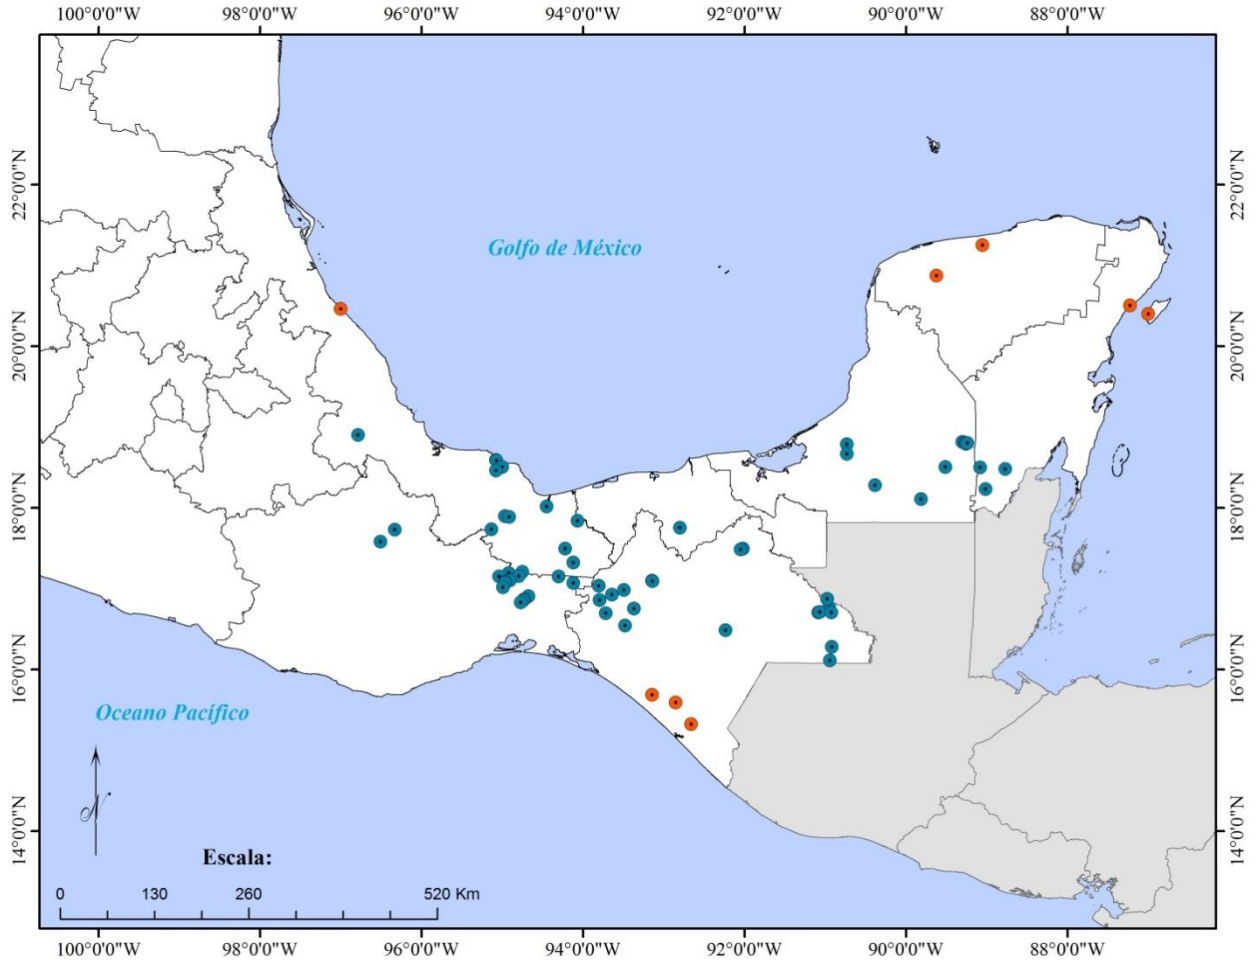

Figura 4. Proyección geográfica de localidades de *Amazona farinosa* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranja: Localidades dudosas.

Figura 5. Proyección geográfica de localidades de *Amazona finschi* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución.

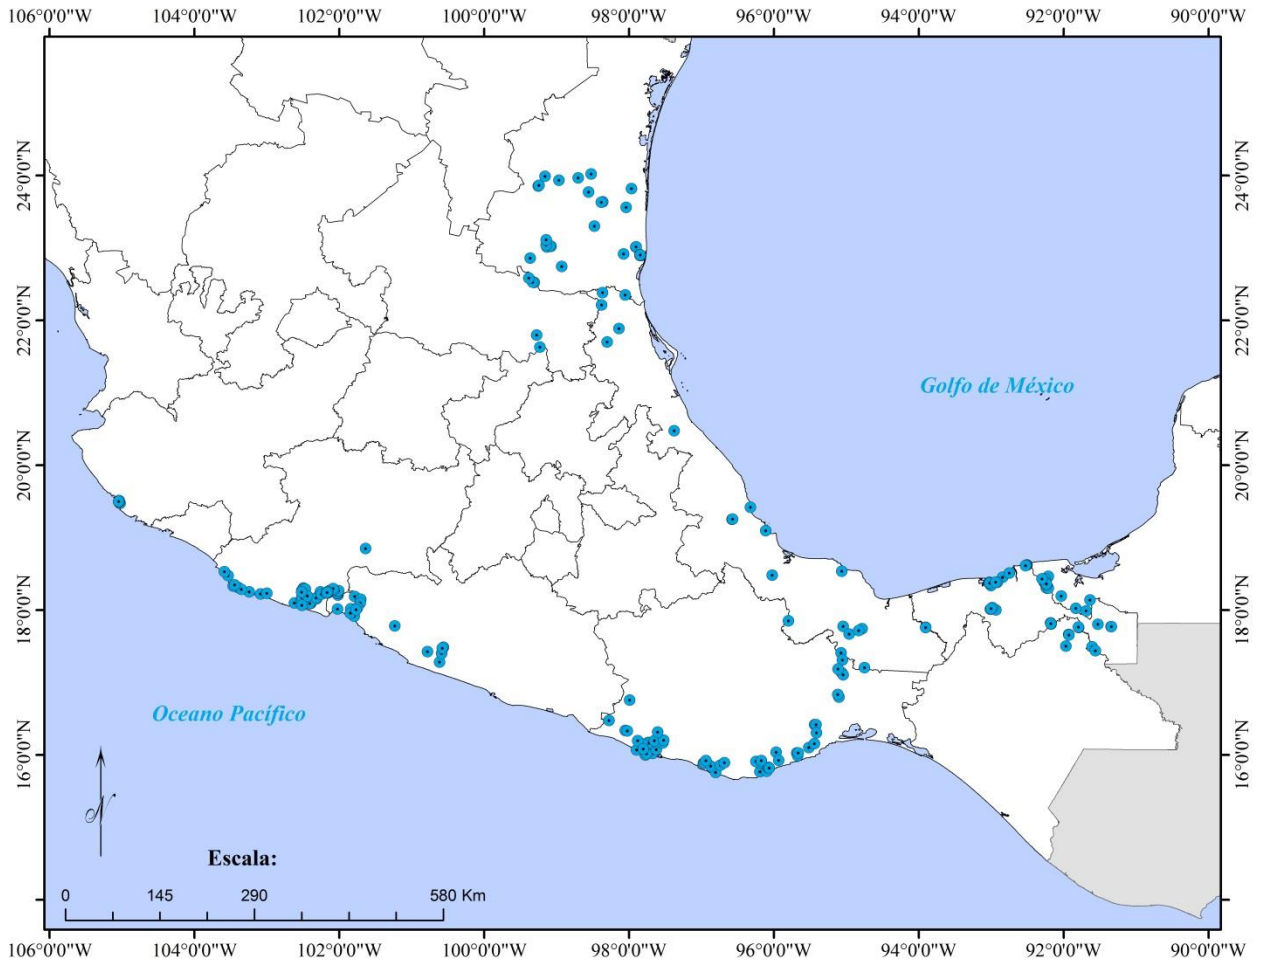

Figura 6. Proyección geográfica de localidades de *Amazona oratrix* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución.

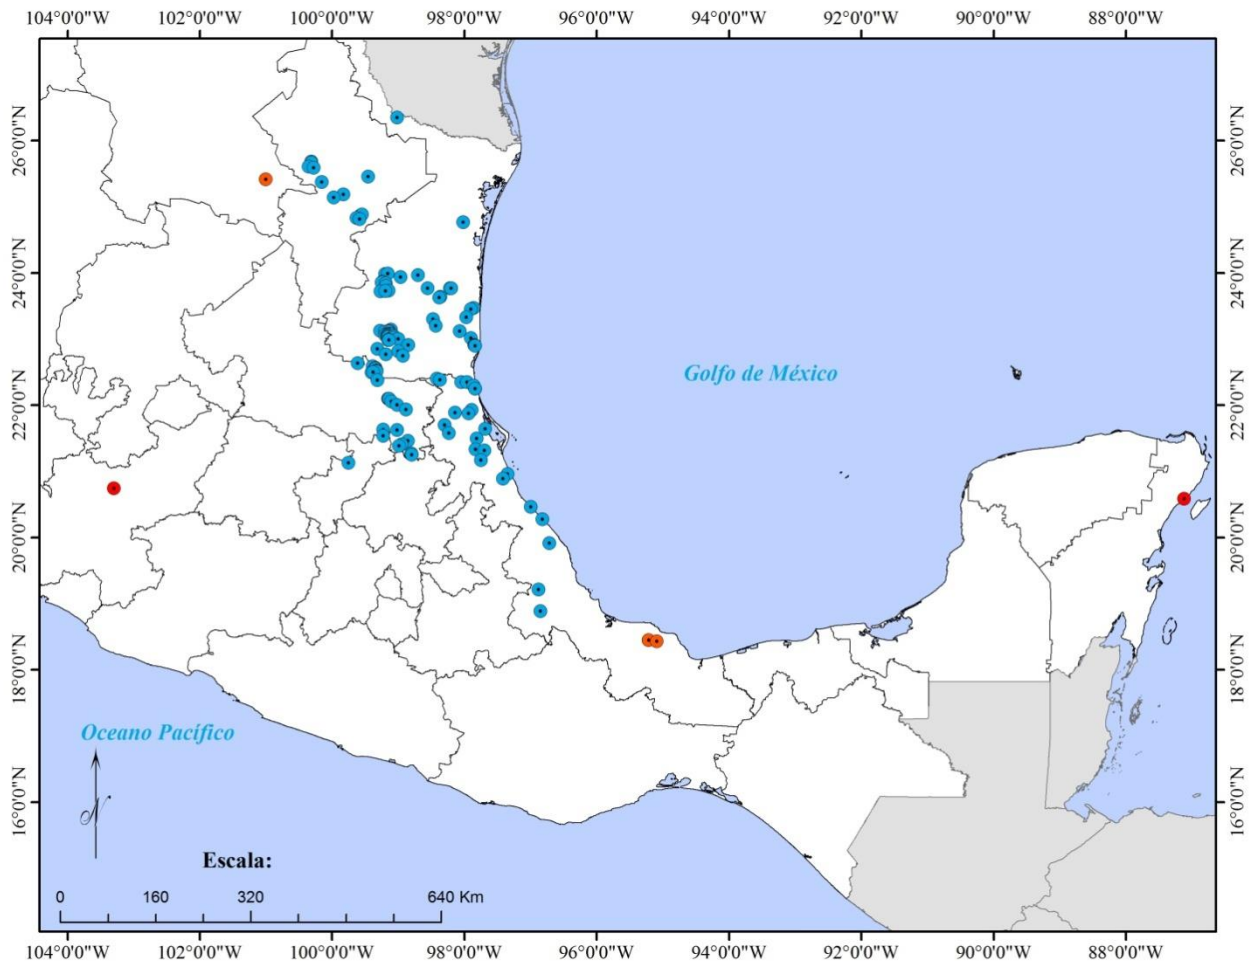

Figura 7. Proyección geográfica de localidades de *Amazona viridigenalis* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas. Rojas: Localidades no utilizadas en la modelación, ya que están notoriamente fuera del área de distribución.

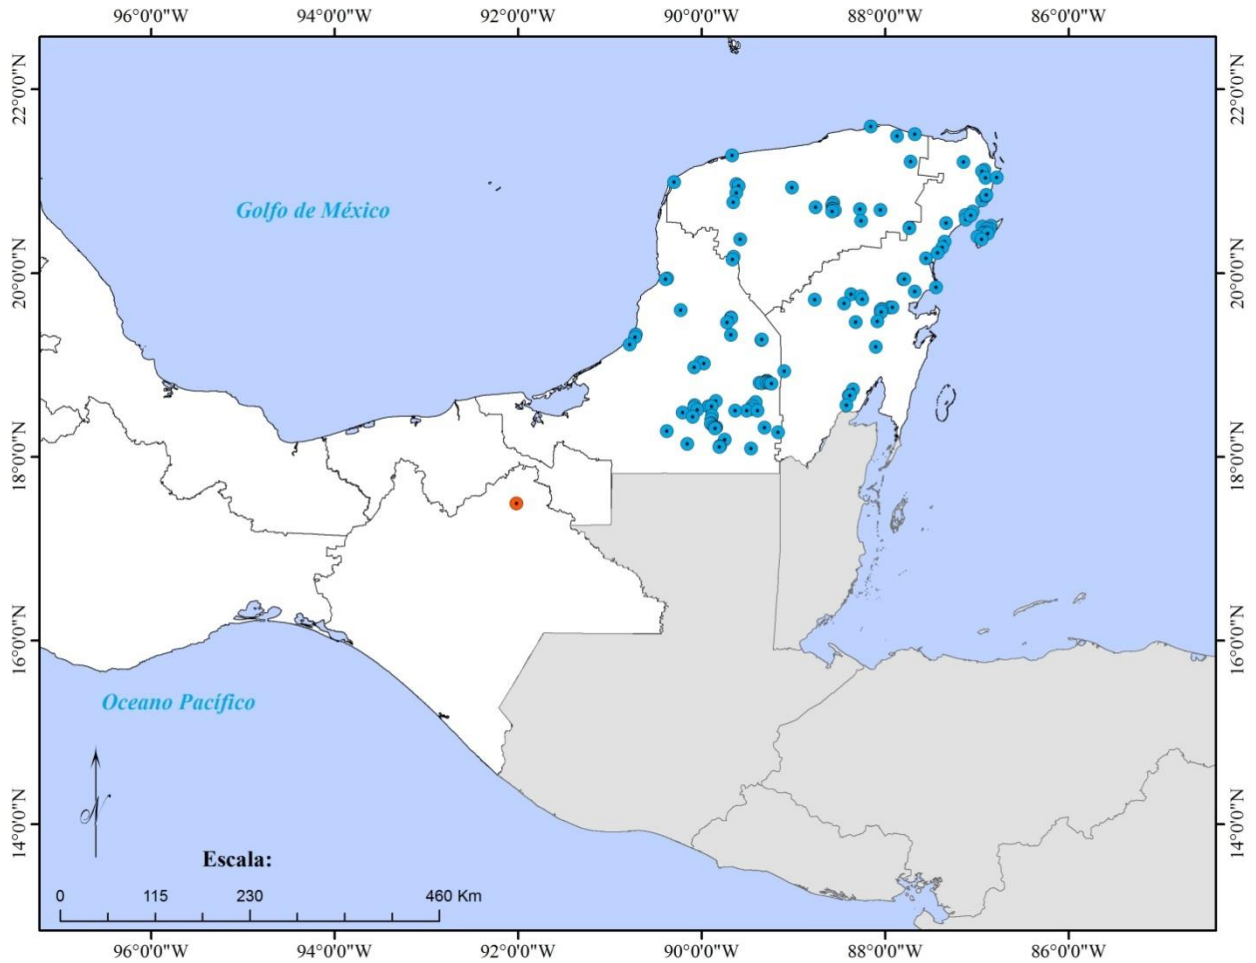

Figura 8. Proyección geográfica de localidades de *Amazona xantholora* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas.

Figura 9. Proyección geográfica de localidades de *Aratinga canicularis* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Rojas: Localidades no utilizadas en la modelación, ya que están notoriamente fuera del área de distribución.

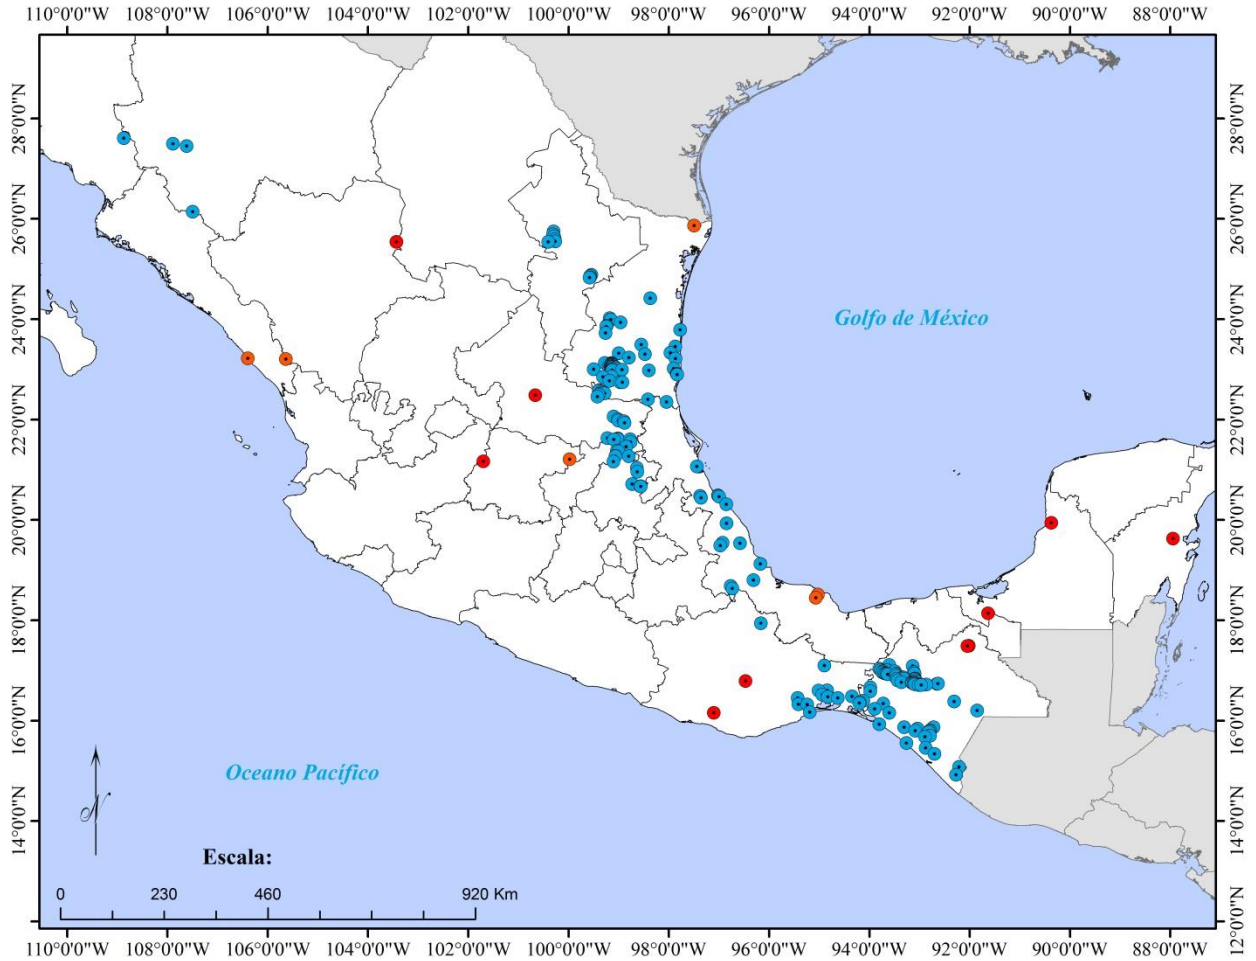

Figura 10. Proyección geográfica de localidades de *Aratinga holochlora* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas. Rojas: Localidades no utilizadas en la modelación, ya que están notoriamente fuera del área de distribución.

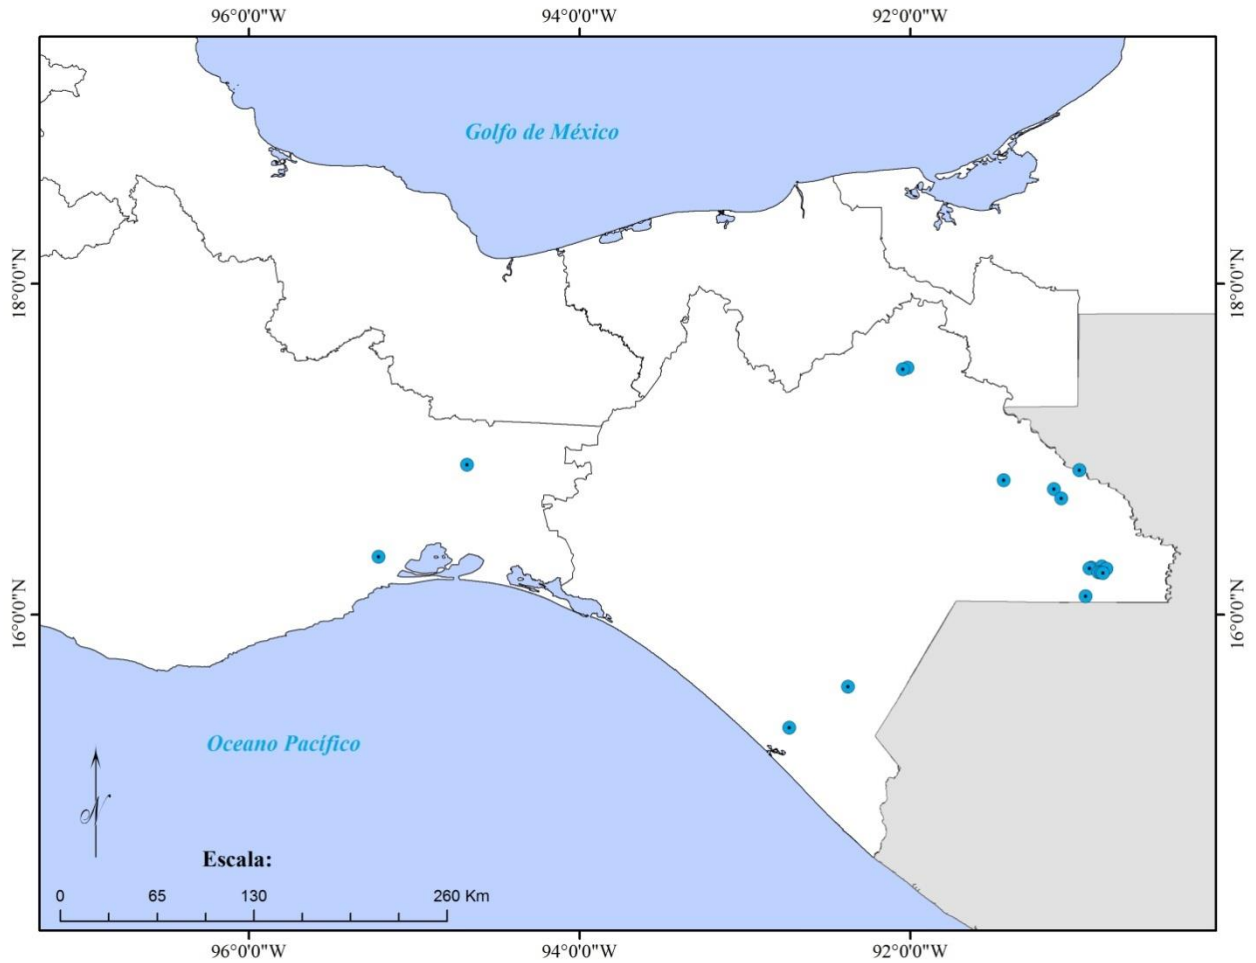

Figura 11. Proyección geográfica de localidades de *Ara macao* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución histórica potencial.

Figura 12. Proyección geográfica de localidades de *Ara militaris* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades antiguas pero útiles para perfil bioclimático.

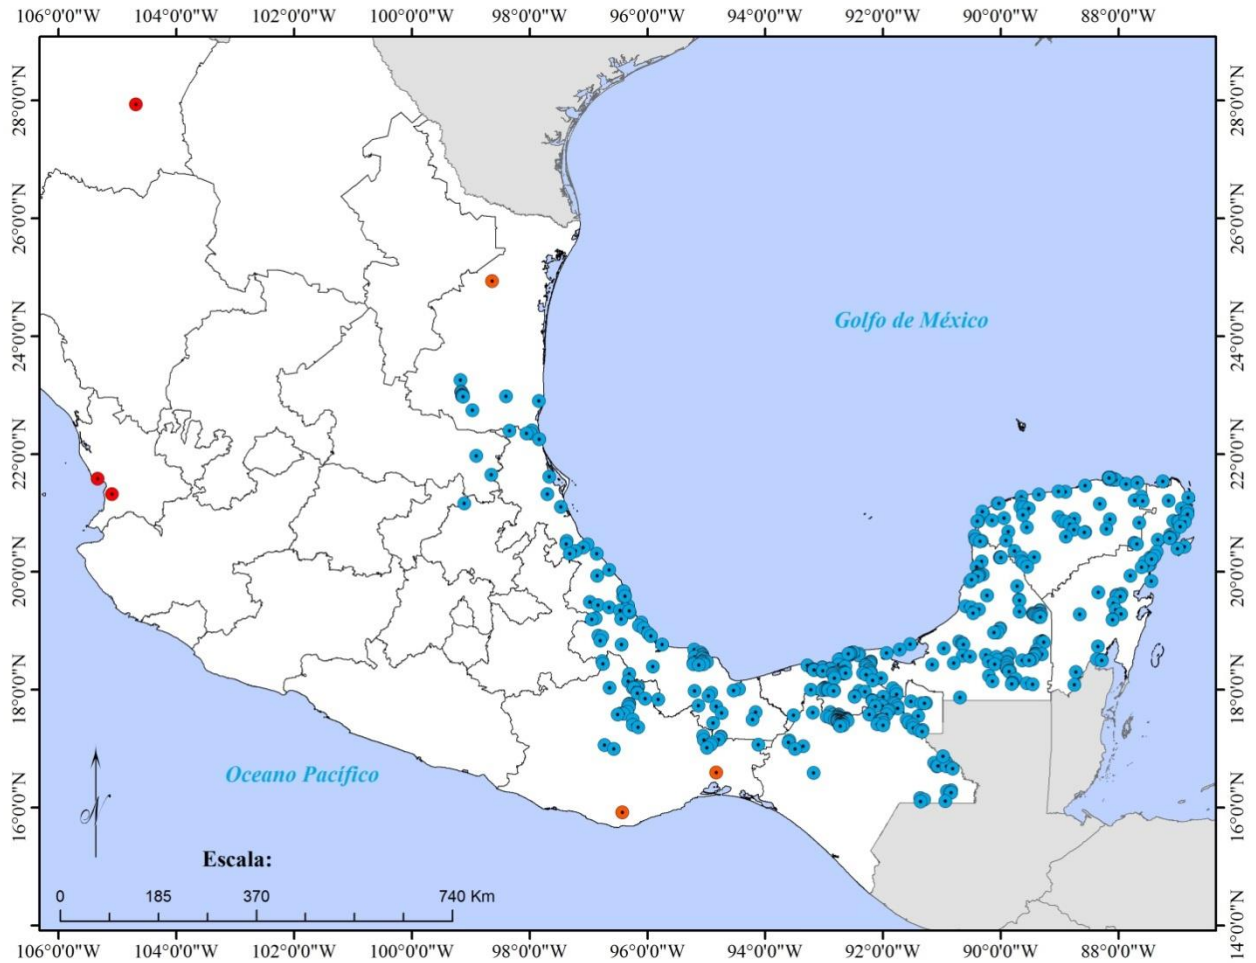

Figura 13. Proyección geográfica del ocalidades de *Aratinga nana* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas. Rojas: Localidades no utilizadas en perfil bioclimático o la modelación, ya que están notoriamente fuera del área de distribución.

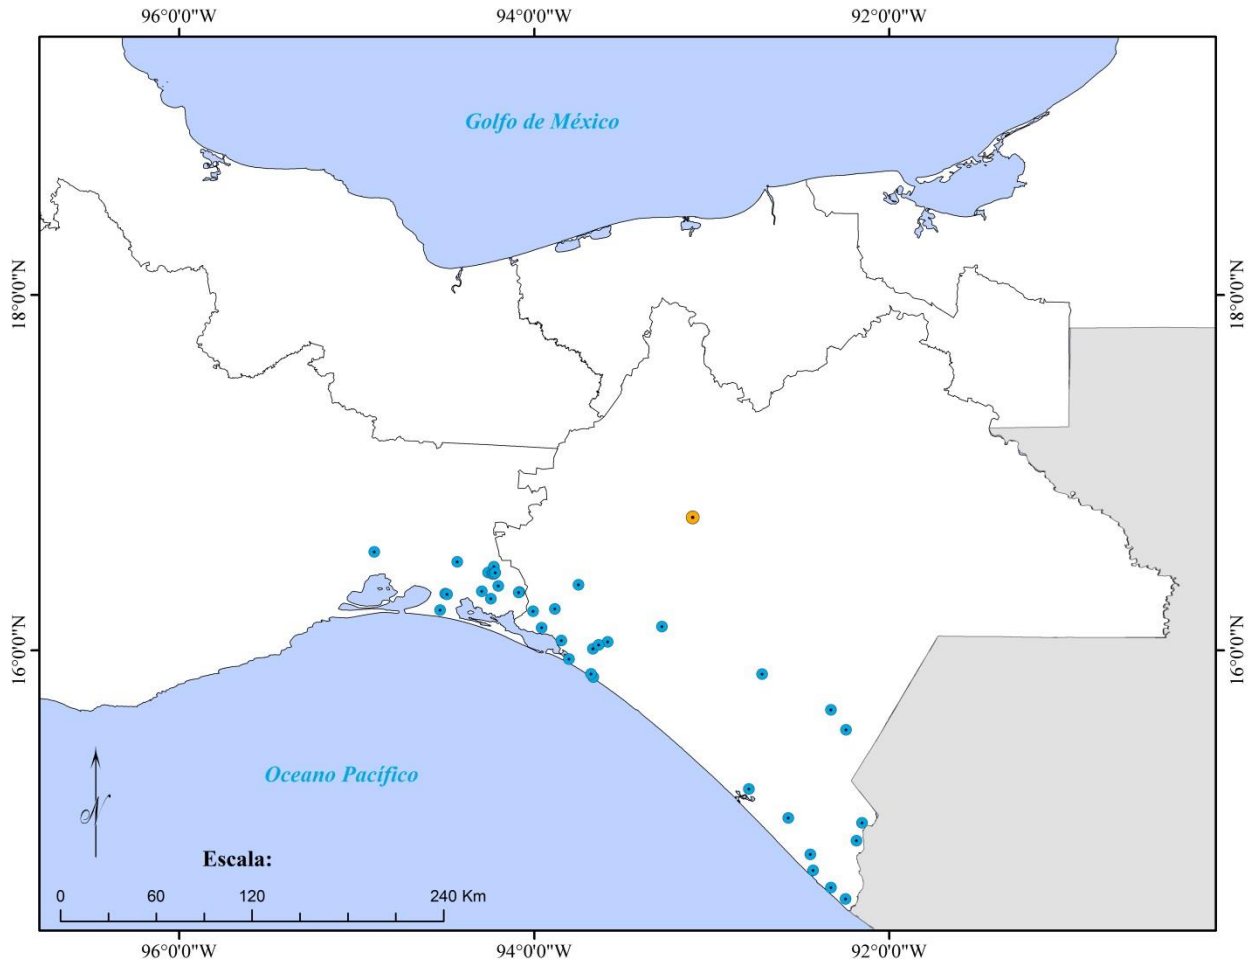

Figura 14. Proyección geográfica de localidades de *Aratinga strenua* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: localidades dudosas y no empleadas para perfil bioclimático.

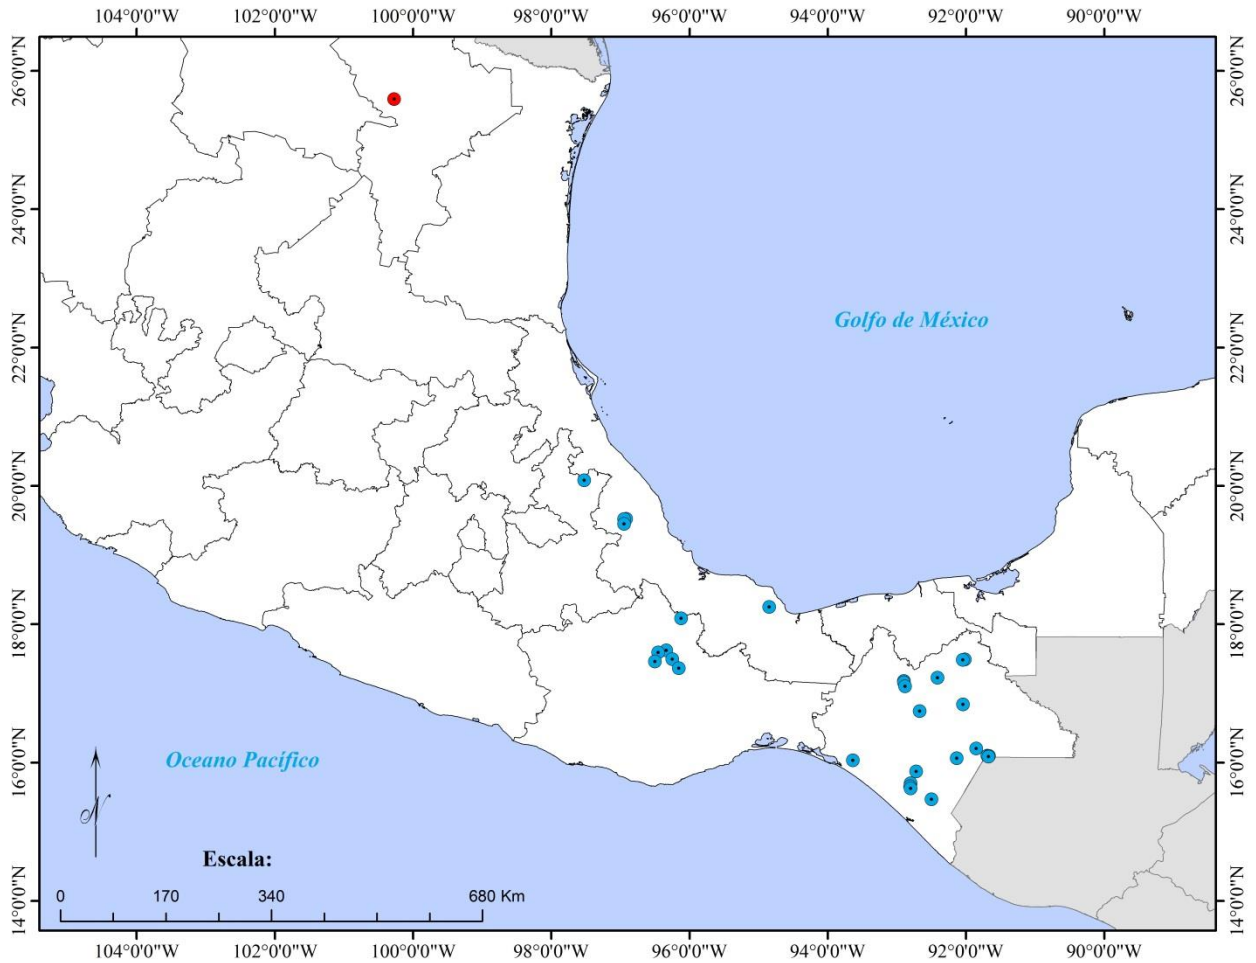

Figura 15. Proyección geográfica de localidades de *Bolborhynchus lineola* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Rojas: Localidades no utilizadas en perfil bioclimático o la modelación, ya que están notoriamente fuera del área de distribución.

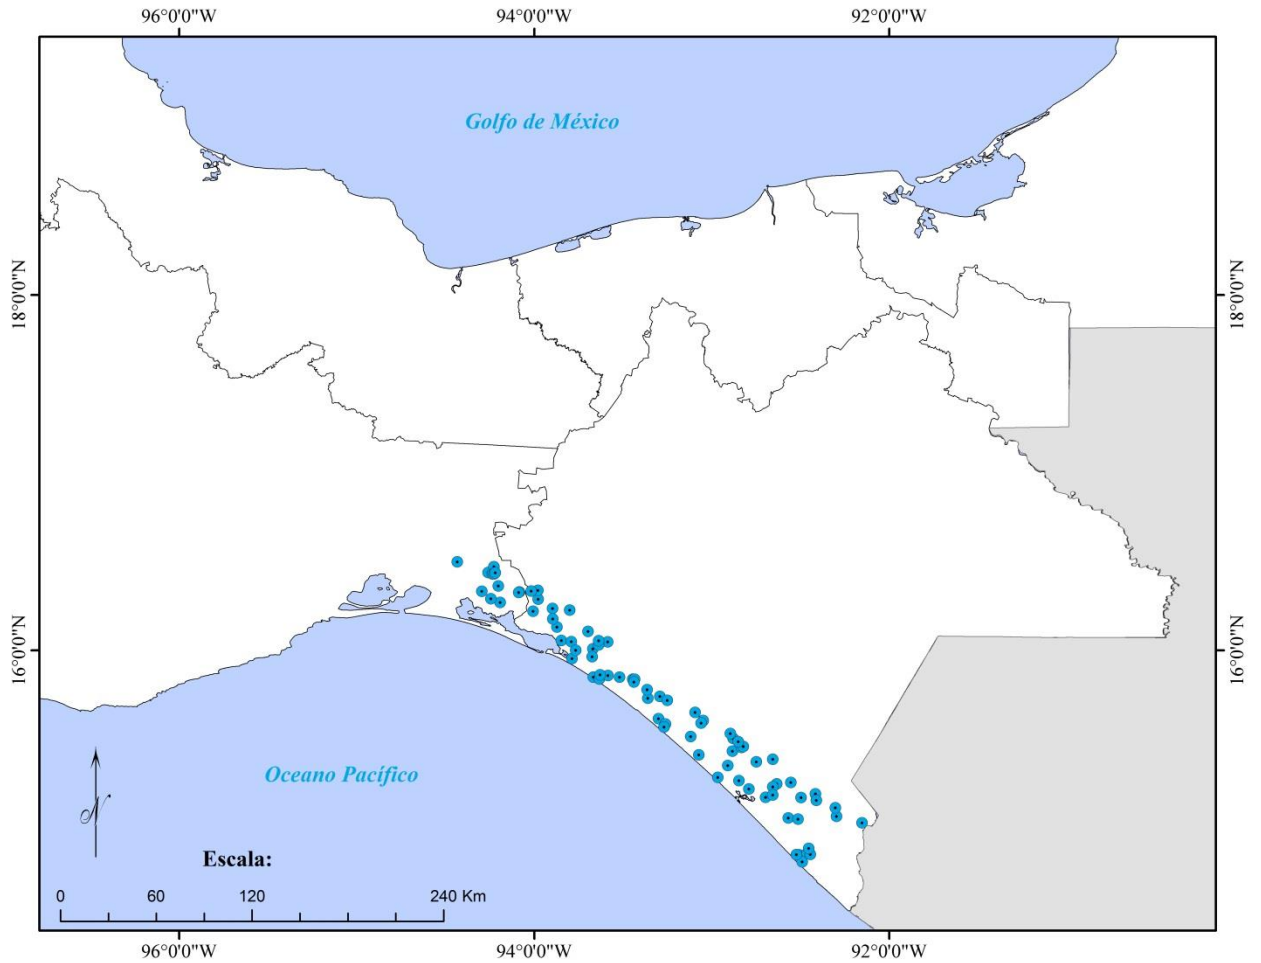

Figura 16. Proyección geográfica de localidades de *Brotogeris jugularis* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución.

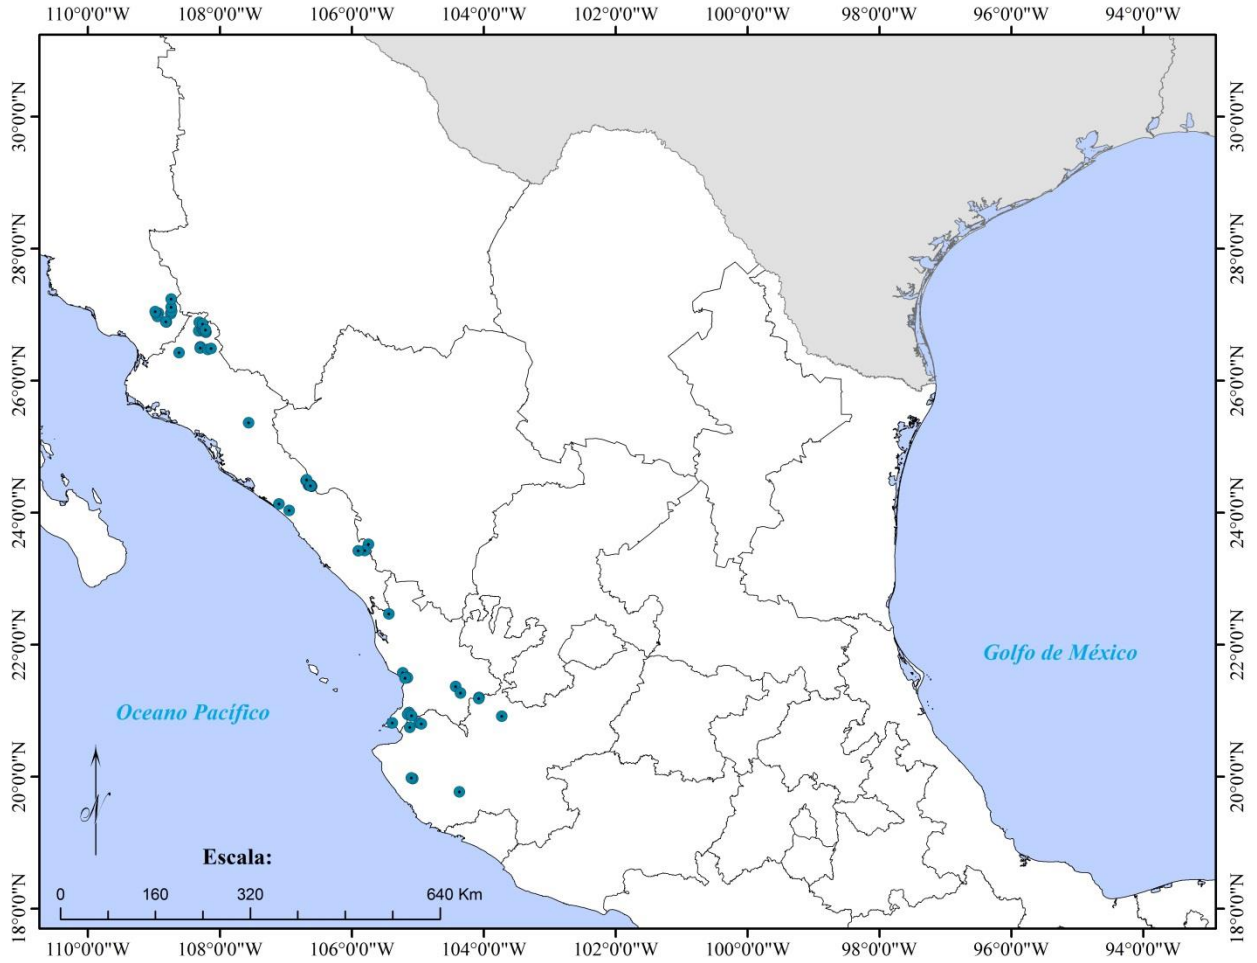

Figura 17. Proyección geográfica de localidades de *Forpus cyanopygius* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución.

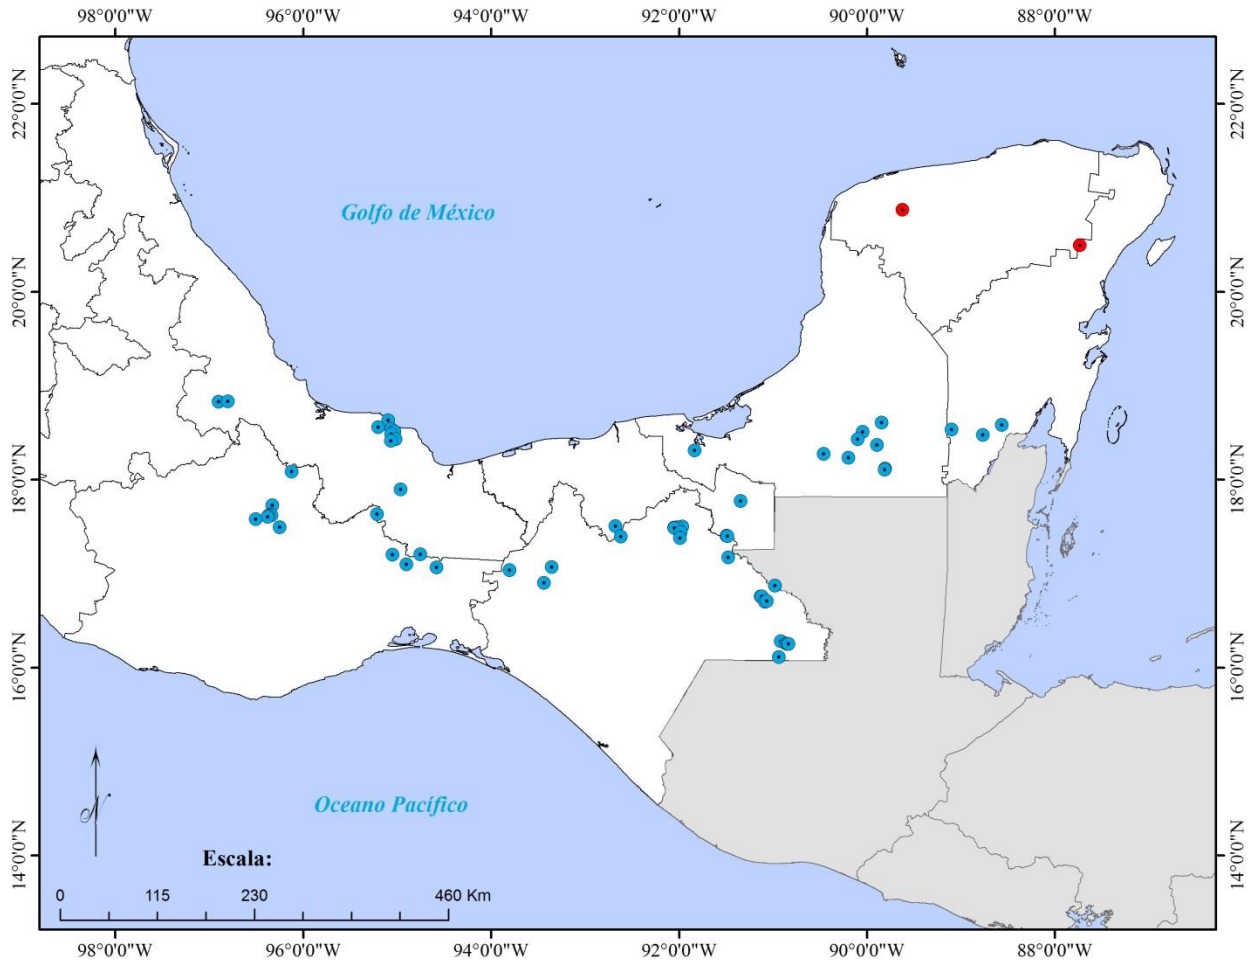

Figura 18. Proyección geográfica de localidades de *Pionopsitta haematotis* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Rojas: Localidades no utilizadas en la modelación, ya que están notoriamente fuera del área de distribución.

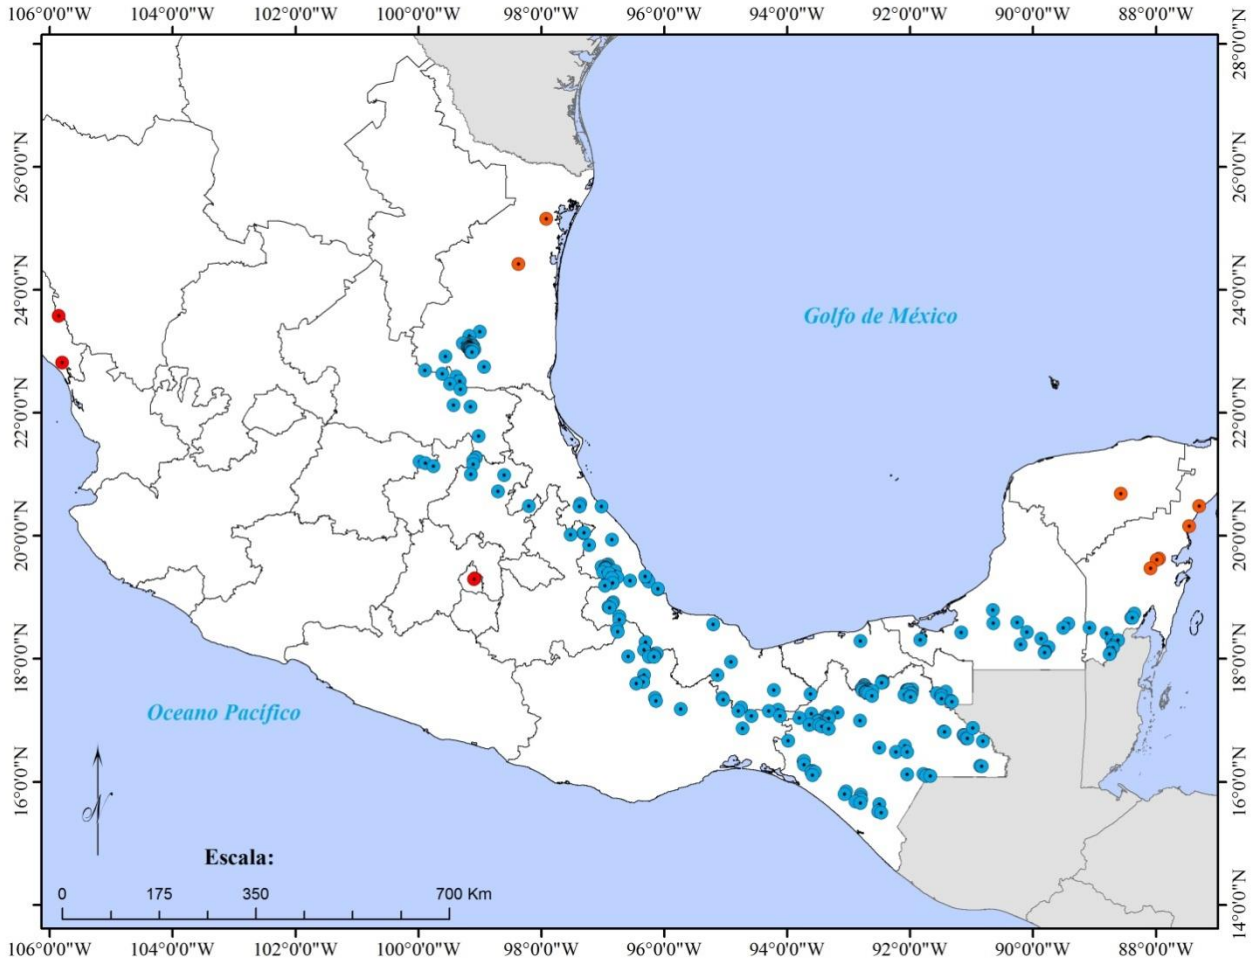

Figura 19. Proyección geográfica de localidades de *Pionus senilis* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas. Rojas: Localidades no utilizadas en la modelación, ya que están notoriamente fuera del área de distribución.

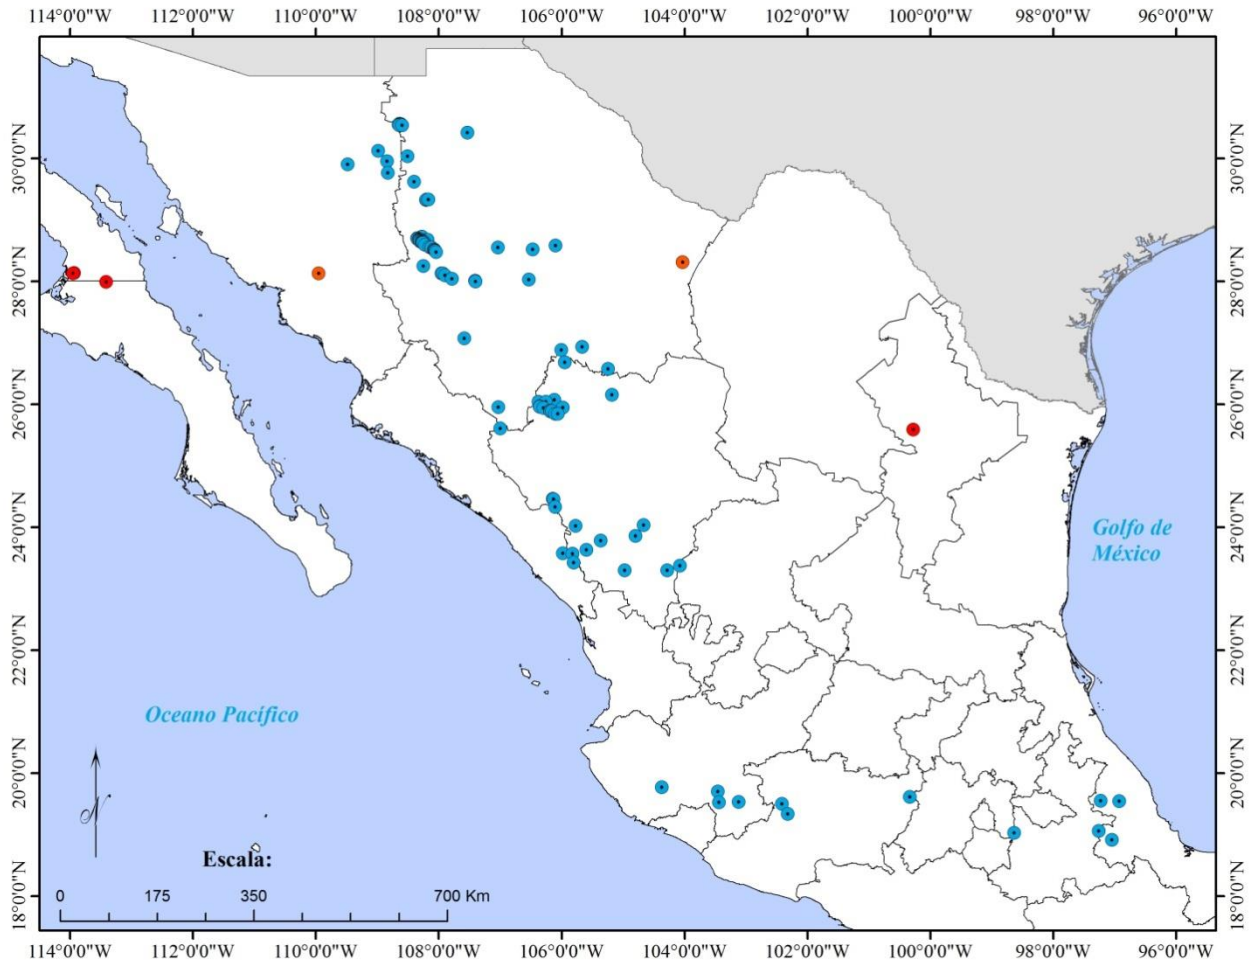

Figura 20. Proyección geográfica de localidades de *Rhynchopsitta pachyrhyncha* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Naranjas: Localidades dudosas. Rojas: Localidades no utilizadas en perfil bioclimático o la modelación, ya que están notoriamente fuera del área de distribución.

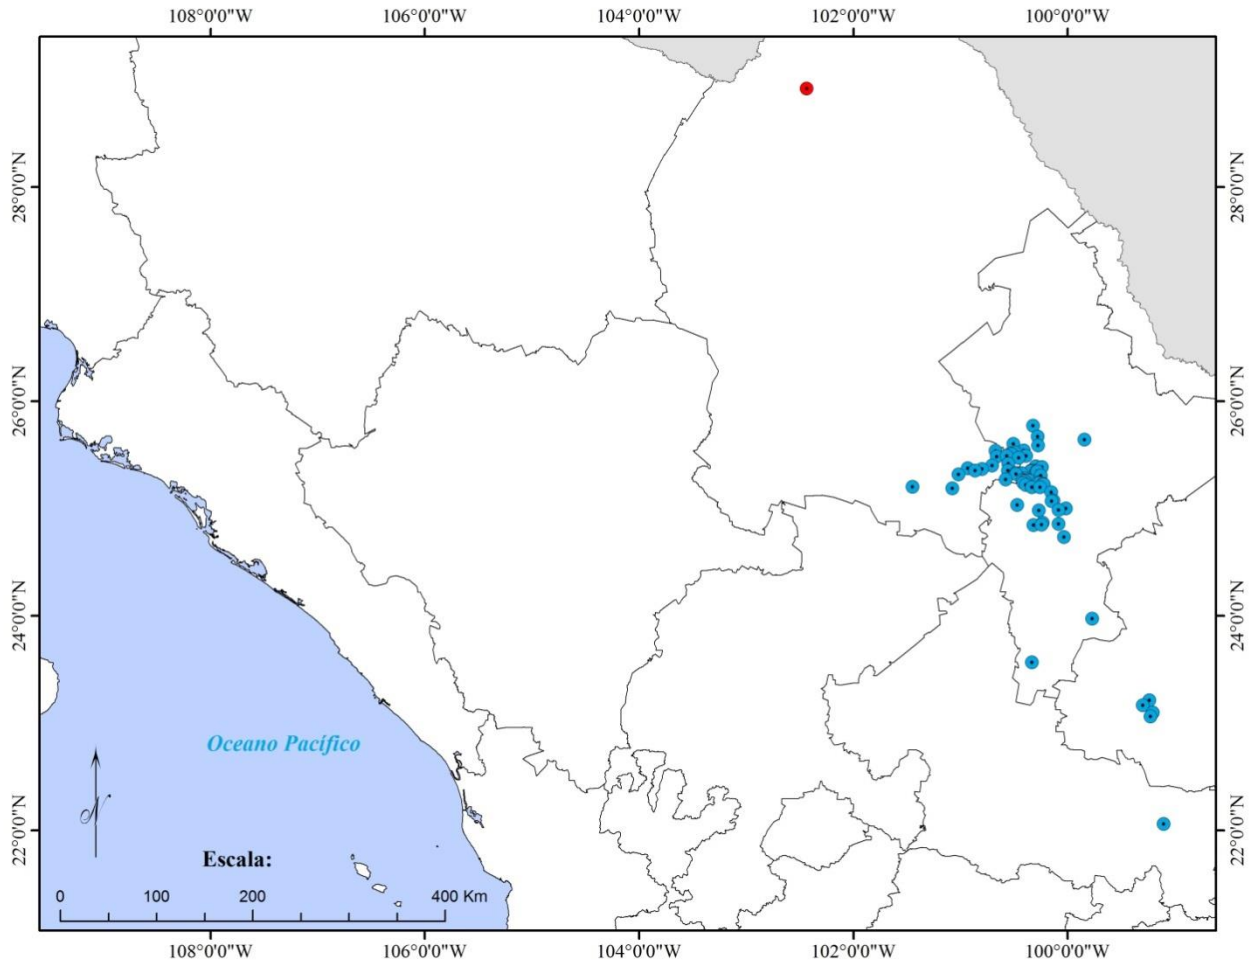

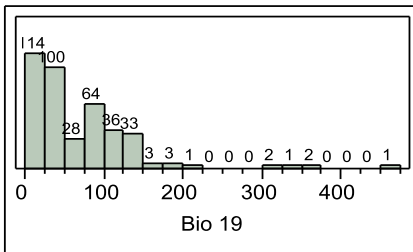

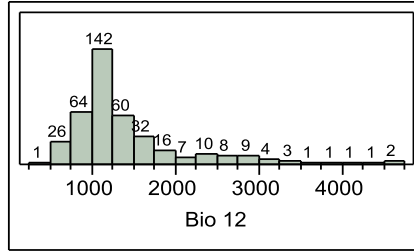

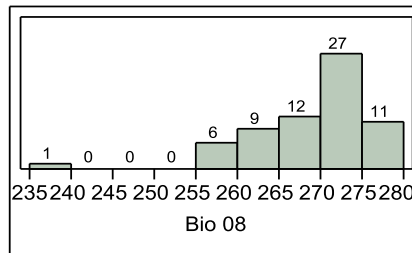

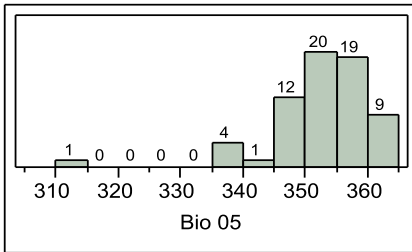

Figura 21. Proyección geográfica de localidades de *Rhynchopsitta terrisi* para verificar la calidad de los datos. Azul: confirmadas dentro del área de distribución. Rojas: Localidades no utilizadas en perfil bioclimático o la modelación, ya que están notoriamente fuera del área de distribución.

<p>Box plot for Bio 01. The y-axis represents temperature in °C, ranging from 21 to 28. The median is approximately 25.5°C. The interquartile range (IQR) is from 25.1°C to 25.7°C. Whiskers extend from 25.0°C to 26.0°C. There are two outliers at approximately 21.8°C and 27.5°C.</p>	<p>Box plot for Bio 02. The y-axis represents temperature in °C, ranging from 10 to 14.5. The median is approximately 10.8°C. The IQR is from 10.7°C to 11.1°C. Whiskers extend from 10.5°C to 11.2°C. There are three outliers at approximately 12.0°C, 13.8°C, and 14.5°C.</p>	<p>Box plot for Bio 03. The y-axis represents temperature in °C, ranging from 6 to 8. The median is approximately 6.7°C. The IQR is from 6.6°C to 6.9°C. Whiskers extend from 6.5°C to 6.9°C. There are two outliers at approximately 7.2°C and 7.8°C.</p>	<p>Box plot for Bio 04. The y-axis represents temperature in °C, ranging from 80 to 180. The median is approximately 153°C. The IQR is from 148°C to 168°C. Whiskers extend from 140°C to 170°C. There are two outliers at approximately 82°C and 175°C.</p>
Bio 05	Bio 06	Bio 07	Bio 08
<p>Box plot for Bio 05. The y-axis represents temperature in °C, ranging from 30 to 37. The median is approximately 33.5°C. The IQR is from 33.4°C to 33.6°C. Whiskers extend from 33.2°C to 33.8°C. There are two outliers at approximately 30.8°C and 36.5°C.</p>	<p>Box plot for Bio 06. The y-axis represents temperature in °C, ranging from 11 to 20. The median is approximately 17.5°C. The IQR is from 16.8°C to 17.8°C. Whiskers extend from 16.8°C to 17.8°C. There are two outliers at approximately 11.8°C and 19.8°C.</p>	<p>Box plot for Bio 07. The y-axis represents temperature in °C, ranging from 15 to 19.5. The median is approximately 16.2°C. The IQR is from 16.0°C to 16.6°C. Whiskers extend from 15.8°C to 16.6°C. There are two outliers at approximately 17.2°C and 19.2°C.</p>	<p>Box plot for Bio 08. The y-axis represents temperature in °C, ranging from 22 to 29. The median is approximately 26.2°C. The IQR is from 25.8°C to 26.4°C. Whiskers extend from 25.8°C to 26.4°C. There are two outliers at approximately 22.2°C and 28.8°C.</p>

Anexo 7. Documentación del material entregado.

Especies incluidas	Especies con modelo	Especies sin modelos	Nombre corto distribución histórica GARP (archivo grid)	Nombre corto distribución histórica Maxent (archivo grid)	Nombre corto distribución actual GARP (archivo grid)	Nombre corto distribución actual Maxent (archivo grid)	Nombre en metabase distribución histórica GARP	Nombre en metabase distribución histórica Maxent	Nombre en metabase distribución actual GARP	Nombre en metabase distribución actual Maxent
<i>Amazona albifrons</i>	<i>Amazona albifrons</i>	-	ama_alb_g_h	ama_alb_m_h	ama_alb_g_a	ama_alb_m_a	Distribución potencial histórica de <i>Amazona albifrons</i> en México usando GARP	Distribución potencial histórica de <i>Amazona albifrons</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona albifrons</i> en México usando GARP	Distribución potencial histórica de <i>Amazona albifrons</i> en México usando Maxent
<i>Amazona auropalliata</i>	<i>Amazona auropalliata</i>	-	ama_aur_g_h	ama_aur_m_h	ama_aur_g_a	ama_aur_m_a	Distribución potencial histórica de <i>Amazona auropalliata</i> en México usando GARP	Distribución potencial histórica de <i>Amazona auropalliata</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona auropalliata</i> en México usando GARP	Distribución potencial histórica de <i>Amazona auropalliata</i> en México usando Maxent
<i>Amazona autumnalis</i>	<i>Amazona autumnalis</i>	-	ama_aut_g_h	ama_aut_m_h	ama_aut_g_a	ama_aut_m_a	Distribución potencial histórica de <i>Amazona autumnalis</i> en México usando GARP	Distribución potencial histórica de <i>Amazona autumnalis</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona autumnalis</i> en México usando GARP	Distribución potencial histórica de <i>Amazona autumnalis</i> en México usando Maxent
<i>Amazona farinosa</i>	<i>Amazona farinosa</i>	-	ama_far_g_h	ama_far_m_h	ama_far_g_a	ama_far_m_a	Distribución potencial histórica de <i>Amazona farinosa</i> en México usando GARP	Distribución potencial histórica de <i>Amazona farinosa</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona farinosa</i> en México usando GARP	Distribución potencial histórica de <i>Amazona farinosa</i> en México usando Maxent
<i>Amazona finschi</i>	<i>Amazona finschi</i>	-	ama_fin_g_h	ama_fin_m_h	ama_fin_g_a	ama_fin_m_a	Distribución potencial histórica de <i>Amazona finschi</i> en México usando GARP	Distribución potencial histórica de <i>Amazona finschi</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona finschi</i> en México usando GARP	Distribución potencial histórica de <i>Amazona finschi</i> en México usando Maxent
<i>Amazona oratrix</i>	<i>Amazona oratrix</i>	-	ama_ora_g_h	ama_ora_m_h	ama_ora_g_a	ama_ora_m_a	Distribución potencial histórica de <i>Amazona oratrix</i> en México usando GARP	Distribución potencial histórica de <i>Amazona oratrix</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona oratrix</i> en México usando GARP	Distribución potencial histórica de <i>Amazona oratrix</i> en México usando Maxent
<i>Amazona viridigenalis</i>	<i>Amazona viridigenalis</i>	-	ama_vir_g_h	ama_vir_m_h	ama_vir_g_a	ama_vir_m_a	Distribución potencial histórica de <i>Amazona viridigenalis</i> en México usando GARP	Distribución potencial histórica de <i>Amazona viridigenalis</i> en México usando Maxent	Distribución potencial histórica de <i>Amazona viridigenalis</i> en México usando GARP	Distribución potencial histórica de <i>Amazona viridigenalis</i> en México usando Maxent

<i>Amazona xantholora</i>	<i>Amazona xantholora</i>	-	ama_xan_g_h	ama_xan_m_h	ama_xan_g_a	ama_xan_m_a	Distribución potencial histórica de <i>Amazona xantholora</i> en México usando GARP	Distribución potencial histórica de <i>Amazona xantholora</i> en México usando Maxent	Distribución po de <i>Amazona xa</i> México usando
<i>Aratinga canicularis</i>	<i>Aratinga canicularis</i>	-	ara_can_g_h	ara_can_m_h	ara_can_g_a	ara_can_m_a	Distribución potencial histórica de <i>Aratinga canicularis</i> en México usando GARP	Distribución potencial histórica de <i>Aratinga canicularis</i> en México usando Maxent	Distribución po de <i>Aratinga can</i> México usando
<i>Aratinga holochlora</i>	<i>Aratinga holochlora</i>	-	ara_hol_g_h	ara_hol_m_h	ara_hol_g_a	ara_hol_m_a	Distribución potencial histórica de <i>Aratinga holochlora</i> en México usando GARP	Distribución potencial histórica de <i>Aratinga holochlora</i> en México usando Maxent	Distribución po de <i>Aratinga ho</i> México usando
<i>Ara macao</i>	<i>Ara macao</i>	-	ara_mac_g_h	ara_mac_m_h	ara_mac_g_a	ara_mac_m_a	Distribución potencial histórica de <i>Ara macao</i> en México usando GARP	Distribución potencial histórica de <i>Ara macao</i> en México usando Maxent	Distribución po de <i>Ara macao</i> e México usando GARP
<i>Ara militaris</i>	<i>Ara militaris</i>	-	ara_mil_g_h	ara_mil_m_h	ara_mil_g_a	ara_mil_m_a	Distribución potencial histórica de <i>Ara militaris</i> en México usando GARP	Distribución potencial histórica de <i>Ara militaris</i> en México usando Maxent	Distribución po de <i>Ara militari</i> usando GARP
<i>Aratinga nana</i>	<i>Aratinga nana</i>	-	ara_nan_g_h	ara_nan_m_h	ara_nan_g_a	ara_nan_m_a	Distribución potencial histórica de <i>Aratinga nana</i> en México usando GARP	Distribución potencial histórica de <i>Aratinga nana</i> en México usando Maxent	Distribución po de <i>Aratinga na</i> usando GARP
<i>Aratinga strenua</i>	<i>Aratinga strenua</i>	-	ara_str_g_h	ara_str_m_h	ara_str_g_a	ara_str_m_a	Distribución potencial histórica de <i>Aratinga strenua</i> en México usando GARP	Distribución potencial histórica de <i>Aratinga strenua</i> en México usando Maxent	Distribución po de <i>Aratinga str</i> usando GARP
<i>Bolborhynchus lineola</i>	<i>Bolborhynchus lineola</i>	-	bol_lin_g_h	bol_lin_m_h	bol_lin_g_a	bol_lin_m_a	Distribución potencial histórica de <i>Bolborhynchus lineola</i> en México usando GARP	Distribución potencial histórica de <i>Bolborhynchus lineola</i> en México usando Maxent	Distribución po de <i>Bolborhynch</i> México usando
<i>Brotogeris jugularis</i>	<i>Brotogeris jugularis</i>	-	bro_jug_g_h	bro_jug_m_h	bro_jug_g_a	bro_jug_m_a	Distribución potencial histórica de <i>Brotogeris jugularis</i> en México usando GARP	Distribución potencial histórica de <i>Brotogeris jugularis</i> en México usando Maxent	Distribución po de <i>Brotogeris j</i> México usando
<i>Forpus cyanopygius</i>	<i>Forpus cyanopygius</i>	-	for_cya_g_h	for_cya_m_h	for_cya_g_a	for_cya_m_a	Distribución potencial histórica de <i>Forpus cyanopygius</i> en México usando GARP	Distribución potencial histórica de <i>Forpus cyanopygius</i> en México usando Maxent	Distribución po de <i>Forpus cyan</i> México usando
<i>Pionopsitta haematotis</i>	<i>Pionopsitta haematotis</i>	-	pio_hae_g_h	pio_hae_m_h	pio_hae_g_a	pio_hae_m_a	Distribución potencial histórica de <i>Pionopsitta haematotis</i> en México usando GARP	Distribución potencial histórica de <i>Pionopsitta haematotis</i> en México usando Maxent	Distribución po de <i>Pionopsitta</i> México usando

<i>Pionus senilis</i>	<i>Pionus senilis</i>	-	pio_sen_g_h	pio_sen_m_h	pio_sen_g_a	pio_sen_m_a	Distribución potencial histórica de <i>Pionus senilisen</i> México usando GARP	Distribución potencial histórica de <i>Pionus senilisen</i> México usando Maxent	Distribución po de <i>Pionus senil</i> usando GARP
<i>Rhynchopsitta pachyrhyncha</i>	<i>Rhynchopsitta pachyrhyncha</i>	-	rhy_ter_g_h	rhy_ter_m_h	rhy_ter_g_a	rhy_ter_m_a	Distribución potencial histórica de <i>Rhynchopsittapachyrhynchaen</i> México usando GARP	Distribución potencial histórica de <i>Rhynchopsittapachyrhynchaen</i> México usando Maxent	Distribución po de <i>Rhynchopsittap</i> México usando
<i>Rhynchopsitta terrisi</i>	<i>Rhynchopsitta terrisi</i>	-	rhy_pac_g_h	rhy_pac_m_h	rhy_pac_g_a	rhy_pac_m_a	Distribución potencial histórica de <i>Rhynchopsitta terrisien</i> México usando GARP	Distribución potencial histórica de <i>Rhynchopsitta terrisien</i> México usando Maxent	Distribución po de <i>Rhynchopsi</i> México usando
